NOTES

Release Date

4th August 2017

This file was automatically derived from the Spectrum 128 ROM 0 disassembly, using a conversion utility created by Paul Farrow.

Any enhancements or corrections should only be made to the Spectrum 128 ROM 0 disassembly and then the utility used to automatically regenerate the Spectrum +2 listing.

Disassembly Contributors

Matthew Wilson (www.matthew-wilson.net/spectrum/rom/)

Andrew Owen (cheveron-AT-gmail.com)

Geoff Wearmouth (gwearmouth-AT-hotmail.com)

Rui Tunes

Paul Farrow (www.fruitcake.plus.com)

Markers

The following markers appear throughout the disassembly:

[...] = Indicates a comment about the code.

???? = Information to be determined.

For bugs, the following marker format is used:

[BUG - xxxx. Credit: yyyy] = Indicates a confirmed bug, with a description 'xxxx' of it and the discoverer 'yyyy'.

[BUG? - xxxx. Credit: yyyy] = Indicates a suspected bug, with a description 'xxxx' of it and the discoverer 'yyyy'.

Since many of the Spectrum 128 ROM routines were re-used in the Spectrum +2 and +3, where a bug was originally identified in the Spectrum +2 or +3 the discoverer is acknowledged along with who located the corresponding bug in the Spectrum 128.

For every bug identified, an example fix is provided and the author acknowledged. Some of these fixes can be made directly within the routines affected since they do not increase the length of those routines. Others require the insertion of extra instructions and hence these cannot be completely fitted within the routines affected. Instead a jump must be made to a patch routine located within a spare area of the ROM.

Fortunately there is 0.5K of unused routines located at \$2355-\$2555 (ROM 0) which are remnants of the original Spanish 128, and another unused routine located at \$3F6A-\$3F75 (ROM 0). This is sufficient space to implement all of the bug fixes suggested.

REFERENCE INFORMATION — PART 1

128 BASIC Mode Limitations

There are a number of limitations when using 128 BASIC mode, some of which are not present when using the equivalent 48 BASIC mode operations.

These are more design decisions than bugs.

- The RAM disk VERIFY command does not verify but simply performs a LOAD.
- The renumber facility will not renumber line numbers that are defined as an expression, e.g. GO TO VAL "10".
- The printer output routine cannot handle binary data and hence EPSON printer ESC codes cannot be sent.
- The Editor has the following limitations:
- Variables cannot have the same name as a keyword. This only applies when entering a program and not when one is loaded in.
- Line number 0 is not supported and will not list properly. It is not possible to directly insert such a line, not even in 48 BASIC mode, and so line number 0 is not officially supported.
- There is a practical limitation on the size of lines that can be entered. It is limited to 20 indented rows, which is the size of the editing buffers. Typed lines greater than 20 rows get inserted into the BASIC program, but only the first 20 rows are shown on screen. Editing such a line causes it to be truncated to 20 rows. There is no warning when the 20 row limit is exceeded.
- It is not possible to directly enter embedded control codes, or to correctly edit loaded in programs that contain them. Loaded programs that contain them will run correctly so long as the lines are not edited.
- It is not possible to embed the string of characters ">=", "<=" or "<>" into a string or REM statement without them being tokenized (this is perhaps more an oversight than a design decision).
- In 48 BASIC mode if the line '10 REM abc: PRINT xyz' is typed then the word PRINT is stored as a new keyword since the colon (arguably incorrectly) reverts to 'K' mode. In 128 BASIC mode, typing the same line stores each letter as a separate character.

Timing Information

Clock Speed = 3.54690 MHz (48K Spectrum clock speed was 3.50000 MHz) Scan line = 228 T-states (48K Spectrum was 224 T-states).

TV scan lines = 311 total, 63 above picture (48K Spectrum had 312 total, 64 above picture).

I/O Details

Memory Paging

Memory paging is controlled by I/O port:

\$7FFD (Out) - Bits 0-2: RAM bank (0-7) to page into memory map at \$C000.

Bit 3 : 0=SCREEN 0 (normal display file in bank 5), 1=SCREEN 1 (shadow display file in bank 7).

Bit 4 : 0=ROM 0 (128K Editor), 1=ROM 1 (48K BASIC).

Bit 5 : 1=Disable further output to this port until a hard reset occurs.

Bit 6-7 : Not used (always write 0).

The Editor ROM (ROM 0) always places a copy of the last value written to port \$7FFD into new system variable BANK_M (\$5B5C).

Memory Map

ROM 0 or 1 resides at \$0000-\$3FFF.

RAM bank 5 resides at \$4000-\$7FFF always.

RAM bank 2 resides at \$8000-\$BFFF always.

Any RAM bank may reside at \$C000-\$FFFF.

Shadow Display File

The shadow screen may be active even when not paged into the memory map.

Contended Memory

Physical RAM banks 1, 3, 5 and 7 are contended with the ULA.

Logical RAM Banks

Throughout ROM 0, memory banks are accessed using a logical numbering scheme, which maps to physical RAM banks as follows:

Logical Bank	Physical Bank
\$00	\$01
\$01	\$03
\$02	\$04
\$03	\$06
\$04	\$07
\$05	\$00

This scheme makes the RAM disk code simpler than having to deal directly with physical RAM bank numbers.

AY-3-8912 Sound Generator

The AY-3-8912 sound generator is controlled by two I/O ports: \$FFFD (Out) - Select a register 0-14. \$FFFD (In) - Read from the selected register.

\$BFFD (In/Out) - Write to the selected register. The status of the register can also be read back.

The AY-3-8912 I/O port A is used to drive the RS232 and Keypad sockets.

Register	Function	Range
0	Channel A fine pitch	8-bit (0-255)
1	Channel A course pitch	4-bit (0-15)
2	Channel B fine pitch	8-bit (0-255)
3	Channel B course pitch	4-bit (0-15)
4	Channel C fine pitch	8-bit (0-255)
5	Channel C course pitch	4-bit (0-15)
6	Noise pitch	5-bit (0-31)
7	Mixer	8-bit (see end of file for description)
8	Channel A volume	4-bit (0-15, see end of file for description)
9	Channel B volume	4-bit (0-15, see end of file for description)
10	Channel C volume	4-bit (0-15, see end of file for description)
11	Envelope fine duration	8-bit (0-255)
12	Envelope course duration	8-bit (0-255)
13	Envelope shape	4-bit (0-15)
14	I/O port A	8-bit (0-255)

See the end of this document for description on the sound generator registers.

I/O Port A (AY-3-8912 Register 14)

This controls the RS232 and Keypad sockets.

Select the port via a write to port \$FFFD with 14, then read via port \$FFFD and write via port \$BFFD.

The state of port \$BFFD can also be read back.

Bit 0: KEYPAD CTS (out) - 0=Spectrum ready to receive, 1=Busy

Bit 1: KEYPAD RXD (out) - 0=Transmit high bit, 1=Transmit low bit

Bit 2: RS232 CTS (out) - 0=Spectrum ready to receive, 1=Busy

Bit 3: RS232 RXD (out) - 0=Transmit high bit, 1=Transmit low bit

Bit 4: KEYPAD DTR (in) - 0=Keypad ready for data, 1=Busy

Bit 5: KEYPAD TXD (in) - 0=Receive high bit, 1=Receive low bit

Bit 6: RS232 DTR (in) - 0=Device ready for data, 1=Busy

Bit 7: RS232 TXD (in) - 0=Receive high bit, 1=Receive low bit

See the end of this document for the pinouts for the RS232 and KEYPAD sockets.

Standard I/O Ports

See the end of this document for descriptions of the standard Spectrum I/O ports.

Error Report Codes

Standard Error Report Codes

See the end of this document for descriptions of the standard error report codes.

New Error Report Codes

a — MERGE error	MERGE! would not execute for some reason - either size or file type wrong.
b — Wrong file type	A file of an inappropriate type was specified during RAM disk operation, for instance a CODE file in LOAD!"name".
c — CODE error	The size of the file would lead to an overrun of the top of memory.
d — Too many brackets	Too many brackets around a repeated phrase in one of the arguments.
e — File already exists	The file name specified has already been used.
f — Invalid name	The file name specified is empty or above 10 characters in length.
g — File does not exist	[Never used by the ROM].
h — File does not exist	The specified file could not be found.
i — Invalid device	The device name following the FORMAT command does not exist or correspond to a physical device.
j — Invalid baud rate	The baud rate for the RS232 was set to 0.
k — Invalid note name	PLAY came across a note or command it didn't recognise, or a command which was in lower case.
l — Number too big	A parameter for a command is an order of magnitude too big.
m — Note out of range	A series of sharps or flats has taken a note beyond the range of the sound chip.
n — Out of range	A parameter for a command is too big or too small. If the error is very large, error L results.
o — Too many tied notes	An attempt was made to tie too many notes together.
p — © 1986 Sinclair Research Ltd	This error is given when too many PLAY channel strings are specified. Up to 8 PLAY channel strings are supported by MIDI devices such as synthesisers, drum machines or sequencers. Note that a PLAY command with more than 8 strings cannot be entered directly from the Editor. The Spanish 128 produces "p Bad parameter" for this error. It could be that the intention was to save memory by using the existing error message of "Q Parameter error" but the change of report code byte was overlooked.

System Variables

New System Variables

These are held in the old ZX Printer buffer at \$5B00-\$5BFF.

Note that some of these names conflict with the system variables used by the ZX Interface 1.

SWAP	EQU \$5B00	20	Swap paging subroutine.
YOUNGER	EQU \$5B14	9	Return paging subroutine.
ONERR	EQU \$5B1D	18	Error handler paging subroutine.
PIN	EQU \$5B2F	5	RS232 input pre-routine.
POUT	EQU \$5B34	22	RS232 token output pre-routine. This can be patched to bypass the control code filter.
POUT2	EQU \$5B4A	14	RS232 character output pre-routine.
TARGET	EQU \$5B58	2	Address of subroutine to call in ROM 1.
RETADDR	EQU \$5B5A	2	Return address in ROM 0.
BANK_M	EQU \$5B5C	1	Copy of last byte output to I/O port \$7FFD.
RAMRST	EQU \$5B5D	1	Stores instruction RST \$08 and used to produce a standard ROM error.
RAMERR	EQU \$5B5E	1	Error number for use by RST \$08 held in RAMRST.
BAUD	EQU \$5B5F	2	Baud rate timing constant for RS232 socket. Default value of 11. [Name clash with ZX Interface 1 system variable at \$5CC3]
SERFL	EQU \$5B61	2	Second character received flag: Bit 0 : 1=Character in buffer. Bits 1-7: Not used (always hold 0).
	\$5B62		Received Character.
COL	EQU \$5B63	1	Current column from 1 to WIDTH.
WIDTH	EQU \$5B64	1	Paper column width. Default value of 80. [Name clash with ZX Interface 1 Edition 2 system variable at \$5CB1]
TVPARS	EQU \$5B65	1	Number of inline parameters expected by RS232 (e.g. 2 for AT).
FLAGS3	EQU \$5B66	1	Flags: [Name clashes with the ZX Interface 1 system variable at \$5CB6] Bit 0: 1=BASIC/Calculator mode, 0=Editor/Menu mode. Bit 1: 1=Auto-run loaded BASIC program. [Set but never tested by the ROM] Bit 2: 1=Editing RAM disk catalogue. Bit 3: 1=Using RAM disk commands, 0=Using cassette commands. Bit 4: 1=Indicate LOAD. Bit 5: 1=Indicate SAVE. Bit 6: 1=Indicate MERGE. Bit 7: 1=Indicate VERIFY.

SPECTRUM +2 ROM o DISASSEMBLY

N_STR1	EQU \$5B67	10	Used by RAM disk to store a filename. [Name clash with ZX Interface 1 system variable at \$5CDA] Used by the renumber routine to store the address of the BASIC line being examined.
HD_00	EQU \$5B71	1	Used by RAM disk to store file header information (see RAM disk Catalogue section below for details). [Name clash with ZX Interface 1 system variable at \$5CE6] Used as column pixel counter in COPY routine. Used by FORMAT command to store specified baud rate. Used by renumber routine to store the number of digits in a pre-renumbered line number reference. [Name clash with ZX Interface 1 system variable at \$5CE7]
HD_0B	EQU \$5B72	2	Used by RAM disk to store header info - length of block. Used as half row counter in COPY routine. Used by renumber routine to generate ASCII representation of a new line number.
HD_0D	EQU \$5B74	2	Used by RAM disk to store file header information (see RAM disk Catalogue section below for details). [Name clash with ZX Interface 1 system variable at \$5CE9]
HD_0F	EQU \$5B76	2	Used by RAM disk to store file header information (see RAM disk Catalogue section below for details). [Name clash with ZX Interface 1 system variable at \$5CEB] Used by renumber routine to store the address of a referenced BASIC line.
HD_11	EQU \$5B78	2	Used by RAM disk to store file header information (see RAM disk Catalogue section below for details). [Name clash with ZX Interface 1 system variable at \$5CED] Used by renumber routine to store existing VARS address/current address within a line.
SC_00	EQU \$5B7A	1	Used by RAM disk to store alternate file header information (see RAM disk Catalogue section below for details).
SC_0B	EQU \$5B7B	2	Used by RAM disk to store alternate file header information (see RAM disk Catalogue section below for details).
SC_0D	EQU \$5B7D	2	Used by RAM disk to store alternate file header information (see RAM disk Catalogue section below for details).
SC_0F	EQU \$5B7F	2	Used by RAM disk to store alternate file header information (see RAM disk Catalogue section below for details).
OLDSP	EQU \$5B81	2	Stores old stack pointer when TSTACK in use.
SFNEXT	EQU \$5B83	2	End of RAM disk catalogue marker. Pointer to first empty catalogue entry.
SFSPACE	EQU \$5B85	3	Number of bytes free in RAM disk (3 bytes, 17 bit, LSB first).
ROW01	EQU \$5B88	1	Stores keypad data for row 3, and flags: Bit 0 : 1=Key '+' pressed. Bit 1 : 1=Key '6' pressed. Bit 2 : 1=Key '5' pressed.

SPECTRUM +2 ROM o DISASSEMBLY

			Bit 3 : 1=Key '4' pressed.
			Bits 4-5: Always 0.
			Bit 6 : 1=Indicates successful communications to the keypad.
			Bit 7 : 1=If communications to the keypad established.
ROW23	EQU \$5B89	1	Stores keypad key press data for rows 1 and 2:
			Bit 0: 1=Key ')' pressed.
			Bit 1: 1=Key '(' pressed.
			Bit 2: 1=Key '*' pressed.
			Bit 3: 1=Key '/' pressed.
			Bit 4: 1=Key '-' pressed.
			Bit 5: 1=Key '9' pressed.
			Bit 6: 1=Key '8' pressed.
			Bit 7: 1=Key '7' pressed.
ROW45	EQU \$5B8A	1	Stores keypad key press data for rows 4 and 5:
			Bit 0: Always 0.
			Bit 1: 1=Key '.' pressed.
			Bit 2: Always 0.
			Bit 3: 1=Key '0' pressed.
			Bit 4: 1=Key 'ENTER' pressed.
			Bit 5: 1=Key '3' pressed.
			Bit 6: 1=Key '2' pressed.
			Bit 7: 1=Key '1' pressed.
SYNRET	EQU \$5B8B	2	Return address for ONERR routine.
LASTV	EQU \$5B8D	5	Last value printed by calculator.
RNLINE	EQU \$5B92	2	Address of the length bytes in the line currently being renumbered.
RNFIRST	EQU \$5B94	2	Starting line number when renumbering. Default value of 10.
RNSTEP	EQU \$5B96	2	Step size when renumbering. Default value of 10.
STRIP1	EQU \$5B98	32	Used as RAM disk transfer buffer (32 bytes to \$5BB7). Used to hold Sinclair stripe character patterns (16 bytes to \$5BA7).
			...
TSTACK	EQU \$5BFF	n	Temporary stack (grows downwards). The byte at \$5BFF is not actually used.

Standard System Variables

These occupy addresses \$5C00-\$5CB5.

See the end of this document for descriptions of the standard system variables.

RAM Disk Catalogue

The catalogue can occupy addresses \$C000-\$EBFF in physical RAM bank 7, starting at \$EBFF and growing downwards.

Each entry contains 20 bytes:

Bytes \$00-\$09: Filename.

Bytes \$0A-\$0C: Start address of file in RAM disk area.

Bytes \$0D-\$0F: Length of file in RAM disk area.

Bytes \$10-\$12: End address of file in RAM disk area (used as current position indicator when loading/saving).

Byte \$13 : Flags:

Bit 0 : 1=Entry requires updating.

Bits 1-7: Not used (always hold 0).

The catalogue can store up to 562 entries, and hence the RAM disk can never hold more than 562 files no matter how small the files themselves are. Note that filenames are case sensitive.

The shadow screen (SCREEN 1) also resides in physical RAM bank 7 and so if more than 217 catalogue entries are created then SCREEN 1 will become corrupted [Credit: Toni Baker, ZX Computing Monthly].

However, since screen 1 cannot be used from BASIC, it may have been a design decision to allow the RAM disk to overwrite it.

The actual files are stored in physical RAM banks 1, 3, 4 and 6 (logical banks 0, 1, 2, 3), starting from \$C000 in physical RAM bank 1 and growing upwards.

A file consists of a 9 byte header followed by the data for the file. The header bytes have the following meaning:

Byte \$00 : File type - \$00=Program, \$01=Numeric array, \$02=Character array, \$03=Code/Screen\$.

Bytes \$01-\$02: Length of program/code block/screen\$/array (\$1B00 for screen\$).

Bytes \$03-\$04: Start of code block/screen\$ (\$4000 for screen\$).

Bytes \$05-\$06: Offset to the variables (i.e. length of program) if a program. For an array, \$05 holds the variable name.

Bytes \$07-\$08: Auto-run line number for a program (\$80 in high byte if no auto-run).

Editor Workspace Variables

These occupy addresses \$EC00-\$FFFF in physical RAM bank 7, and form a workspace used by 128 BASIC Editor.

\$EC00	3	Byte 0: Flags used when inserting a line into the BASIC program (first 4 bits are mutually exclusive).
		Bit 0: 1=First row of the BASIC line off top of screen.
		Bit 1: 1=On first row of the BASIC line.
		Bit 2: 1=Using lower screen and only first row of the BASIC line visible.
		Bit 3: 1=At the end of the last row of the BASIC line.
		Bit 4: Not used (always 0).
		Bit 5: Not used (always 0).
		Bit 6: Not used (always 0).

SPECTRUM +2 ROM o DISASSEMBLY

		Bit 7: 1=Column with cursor not yet found. Byte 1: Column number of current position within the BASIC line being inserted. Used when fetching characters. Byte 2: Row number of current position within the BASIC line is being inserted. Used when fetching characters.
\$EC03	3	Byte 0: Flags used upon an error when inserting a line into the BASIC program (first 4 bits are mutually exclusive). Bit 0: 1=First row of the BASIC line off top of screen. Bit 1: 1=On first row of the BASIC line. Bit 2: 1=Using lower screen and only first row of the BASIC line visible. Bit 3: 1=At the end of the last row of the BASIC line. Bit 4: Not used (always 0). Bit 5: Not used (always 0). Bit 6: Not used (always 0). Bit 7: 1=Column with cursor not yet found. Byte 1: Start column number where BASIC line is being entered. Always holds 0. Byte 2: Start row number where BASIC line is being entered.
\$EC06	2	Count of the number of editable characters in the BASIC line up to the cursor within the Screen Line Edit Buffer.
\$EC08	2	Version of E_PPC used by BASIC Editor to hold last line number entered.
\$EC0C	1	Current menu index.
\$EC0D	1	Flags used by 128 BASIC Editor: Bit 0: 1=Screen Line Edit Buffer (including Below-Screen Line Edit Buffer) is full. Bit 1: 1=Menu is displayed. Bit 2: 1=Using RAM disk. Bit 3: 1=Current line has been altered. Bit 4: 1=Return to calculator, 0=Return to main menu. Bit 5: 1=Do not process the BASIC line (used by the Calculator). Bit 6: 1=Editing area is the lower screen, 0=Editing area is the main screen. Bit 7: 1=Waiting for key press, 0=Got key press.
\$EC0E	1	Mode: \$00 = Edit Menu mode. \$04 = Calculator mode. \$07 = Tape Loader mode. [Effectively not used as overwritten by \$FF] \$FF = Tape Loader mode.
\$EC0F	1	Main screen colours used by the 128 BASIC Editor - alternate ATTR_P.
\$EC10	1	Main screen colours used by the 128 BASIC Editor - alternate MASK_P.

SPECTRUM +2 ROM o DISASSEMBLY

\$EC11	1	Temporary screen colours used by the 128 BASIC Editor - alternate ATTR_T.
\$EC12	1	Temporary screen colours used by the 128 BASIC Editor - alternate MASK_T.
\$EC13	1	Temporary store for P_FLAG: Bit 0: 1=OVER 1, 0=OVER 0. Bit 1: Not used (always 0). Bit 2: 1=INVERSE 1, INVERSE 0. Bit 3: Not used (always 0). Bit 4: 1=Using INK 9. Bit 5: Not used (always 0). Bit 6: 1=Using PAPER 9. Bit 7: Not used (always 0).
\$EC14	1	Not used.
\$EC15	1	Holds the number of editing lines: 20 for the main screen, 1 for the lower screen.
\$EC16	735	Screen Line Edit Buffer. This represents the text on screen that can be edited. It holds 21 rows, with each row consisting of 32 characters followed by 3 data bytes. Areas of white space that do not contain any editable characters (e.g. the indent that starts subsequent rows of a BASIC line) contain the value \$00. Data Byte 0: Bit 0: 1=The first row of the BASIC line. Bit 1: 1=Spans onto next row. Bit 2: Not used (always 0). Bit 3: 1=The last row of the BASIC line. Bit 4: 1=Associated line number stored. Bit 5: Not used (always 0). Bit 6: Not used (always 0). Bit 7: Not used (always 0). Data Bytes 1-2: Line number of corresponding BASIC line (stored for the first row of the BASIC line only, holds \$0000).
\$EEF5	1	Flags used when listing the BASIC program: Bit 0 : 0=Not on the current line, 1=On the current line. Bit 1 : 0=Previously found the current line, 1=Not yet found the current line. Bit 2 : 0=Enable display file updates, 1=Disable display file updates. Bits 3-7: Not used (always 0).
\$EEF6	1	Store for temporarily saving the value of TVFLAG.
\$EEF7	1	Store for temporarily saving the value of COORDS.
\$EEF9	1	Store for temporarily saving the value of P_POSN.
\$EEFA	2	Store for temporarily saving the value of PR_CC.

SPECTRUM +2 ROM 0 DISASSEMBLY

\$EEFC	2	Store for temporarily saving the value of ECHO_E.
\$EEFE	2	Store for temporarily saving the value of DF_CC.
\$EF00	2	Store for temporarily saving the value of DF_CCL.
\$EF01	1	Store for temporarily saving the value of S_POSN.
\$EF03	2	Store for temporarily saving the value of SPOSNL.
\$EF05	1	Store for temporarily saving the value of SCR_CT.
\$EF06	1	Store for temporarily saving the value of ATTR_P.
\$EF07	1	Store for temporarily saving the value of MASK_P.
\$EF08	1	Store for temporarily saving the value of ATTR_T.
\$EF09	1512	Used to store screen area (12 rows of 14 columns) where menu will be shown. The rows are stored one after the other, with each row consisting of the following: - 8 lines of 14 display file bytes. - 14 attribute file bytes.
\$F4F1-\$F6E9		Not used. 505 bytes.
\$F6EA	2	The jump table address for the current menu.
\$F6EC	2	The text table address for the current menu.
\$F6EE	1	Cursor position info - Current row number.
\$F6EF	1	Cursor position info - Current column number.
\$F6F0	1	Cursor position info - Preferred column number. Holds the last user selected column position. The Editor will attempt to place the cursor on this column when the user moves up or down to a new line.
\$F6F1	1	Edit area info - Top row threshold for scrolling up.
\$F6F2	1	Edit area info - Bottom row threshold for scrolling down.
\$F6F3	1	Edit area info - Number of rows in the editing area.
\$F6F4	1	Flags used when deleting: Bit 0 : 1=Deleting on last row of the BASIC line, 0=Deleting on row other than the last row of the BASIC line. Bits 1-7: Not used (always 0).
\$F6F5	1	Number of rows held in the Below-Screen Line Edit Buffer.
\$F6F6	2	Intended to point to the next location to access within the Below-Screen Line Edit Buffer, but incorrectly initialised to \$0000 by the routine at \$30FC (ROM 0) and then never used.
\$F6F8	735	Below-Screen Line Edit Buffer. Holds the remainder of a BASIC line that has overflowed off the bottom of the Screen Line Edit Buffer. It can hold 21 rows, with each row consisting of 32 characters followed by 3 data bytes. Areas of white space that do not contain any editable characters (e.g. the indent that starts subsequent rows of a BASIC line) contain the value \$00. Data Byte 0: Bit 0: 1=The first row of the BASIC line. Bit 1: 1=Spans onto next row.

SPECTRUM +2 ROM o DISASSEMBLY

		Bit 2: Not used (always 0).
		Bit 3: 1=The last row of the BASIC line.
		Bit 4: 1=Associated line number stored.
		Bit 5: Not used (always 0).
		Bit 6: Not used (always 0).
		Bit 7: Not used (always 0).
		Data Bytes 1-2: Line number of corresponding BASIC line (stored for the first row of the BASIC line only, holds \$0000).
\$F9D7	2	Line number of the BASIC line in the program area being edited (or \$0000 for no line).
\$F9DB	1	Number of rows held in the Above-Screen Line Edit Buffer.
\$F9DC	2	Points to the next location to access within the Above-Screen Line Edit Buffer.
\$F9DE	700	Above-Screen Line Edit Buffer. Holds the rows of a BASIC line that has overflowed off the top of the Screen Line Edit Buffer. It can hold 20 rows, with each row consisting of 32 characters followed by 3 data bytes. Areas of white space that do not contain any editable characters (e.g. the indent that starts subsequent rows of a BASIC line) contain the value \$00. Data Byte 0: Bit 0: 1=The first row of the BASIC line. Bit 1: 1=Spans onto next row. Bit 2: Not used (always 0). Bit 3: 1=The last row of the BASIC line. Bit 4: 1=Associated line number stored. Bit 5: Not used (always 0). Bit 6: Not used (always 0). Bit 7: Not used (always 0). Data Bytes 1-2: Line number of corresponding BASIC line (stored for the first row of the BASIC line only, holds \$0000).
\$FC9A	2	The line number at the top of the screen, or \$0000 for the first line.
\$FC9E	1	\$00=Print a leading space when constructing keyword.
\$FC9F	2	Address of the next character to fetch within the BASIC line in the program area, or \$0000 for no next character.
\$FCA1	2	Address of the next character to fetch from the Keyword Construction Buffer, or \$0000 for no next character.
\$FCA3	11	Keyword Construction Buffer. Holds either a line number or keyword string representation.
\$FCAE-\$FCFC		Construct a BASIC Line routine. « RAM routine - See end of file for description »
\$FCFD-\$FD2D		Copy String Into Keyword Construction Buffer routine. « RAM routine - See end of file for description »
\$FD2E-\$FD69		Identify Character Code of Token String routine. « RAM routine - See end of file for description »

SPECTRUM +2 ROM o DISASSEMBLY

\$FD6A	1	Flags used when shifting BASIC lines within edit buffer rows [Redundant]: Bit 0 : 1=Set to 1 but never reset or tested. Possibly intended to indicate the start of a new BASIC line and hence whether indentation required. Bit 1-7: Not used (always 0).
\$FD6B	1	The number of characters to indent subsequent rows of a BASIC line by.
\$FD6C	1	Cursor settings (indexed by IX+\$00) - initialised to \$00, but never used.
\$FD6D	1	Cursor settings (indexed by IX+\$01) - number of rows above the editing area.
\$FD6E	1	Cursor settings (indexed by IX+\$02) - initialised to \$00 (when using lower screen) or \$14 (when using main screen), but never subsequently used.
\$FD6F	1	Cursor settings (indexed by IX+\$03) - initialised to \$00, but never subsequently used.
\$FD70	1	Cursor settings (indexed by IX+\$04) - initialised to \$00, but never subsequently used.
\$FD71	1	Cursor settings (indexed by IX+\$05) - initialised to \$00, but never subsequently used.
\$FD72	1	Cursor settings (indexed by IX+\$06) - attribute colour.
\$FD73	1	Cursor settings (indexed by IX+\$07) - screen attribute where cursor is displayed.
\$FD74	9	The Keyword Conversion Buffer holding text to examine to see if it is a keyword.
\$FD7D	2	Address of next available location within the Keyword Conversion Buffer.
\$FD7F	2	Address of the space character between words in the Keyword Conversion Buffer.
\$FD81	1	Keyword Conversion Buffer flags, used when tokenizing a BASIC line: Bit 0 : 1=Buffer contains characters. Bit 1 : 1=Indicates within quotes. Bit 2 : 1=Indicates within a REM. Bits 3-7: Not used (always reset to 0).
\$FD82	2	Address of the position to insert the next character within the BASIC line workspace. The BASIC line is created at the spare space pointed to by E_LINE.
\$FD84	1	BASIC line insertion flags, used when inserting a characters into the BASIC line workspace: Bit 0 : 1=The last character was a token. Bit 1 : 1=The last character was a space. Bits 2-7: Not used (always 0).
\$FD85	2	Count of the number of characters in the typed BASIC line being inserted.

SPECTRUM +2 ROM 0 DISASSEMBLY

\$FD87	2	Count of the number of characters in the tokenized version of the BASIC line being inserted.
\$FD89	1	Holds '<' or '>' if this was the previously examined character during tokenization of a BASIC line, else \$00.
\$FD8A	1	Locate Error Marker flag, holding \$01 is a syntax error was detected on the BASIC line being inserted and the equivalent position within the typed BASIC line needs to be found with, else it holds \$00 when tokenizing a BASIC line.
\$FD8B	2	Stores the stack pointer for restoration upon an insertion error into the BASIC line workspace.
\$FD8C-\$FF23		Not used. 408 bytes.
\$FF24	2	Never used. An attempt is made to set it to \$EC00. This is a remnant from the Spanish 128, which stored the address of the Screen Buffer here. The value is written to RAM bank 0 instead of RAM bank 7, and the value never subsequently accessed.
\$FF26	2	Not used.
\$FF28-\$FF60		Not used. On the Spanish 128 this memory holds a routine that copies a character into the display file. The code to copy to routine into RAM, and the routine itself are present in ROM 0 but are never executed. « RAM routine - See end of file for description »
\$FF61-\$FFFF		Not used. 159 bytes.

RESTART ROUTINES — PART 1

RST \$10, \$18 and \$20 call the equivalent subroutines in ROM 1, via RST \$28.

RST \$00 - Reset the machine.

RST \$08 - Not used. Would have invoked the ZX Interface 1 if fitted.

SPECTRUM +2 ROM o DISASSEMBLY

RST \$10 - Print a character (equivalent to RST \$10 ROM 1).
RST \$18 - Collect a character (equivalent to RST \$18 ROM 1).
RST \$20 - Collect next character (equivalent to RST \$20 ROM 1).
RST \$28 - Call routine in ROM 1.
RST \$30 - Not used.
RST \$38 - Not used.

RST \$00 — Reset Machine

L0000:	ORG \$0000 DI LD BC,\$692B	Ensure interrupts are disabled.
L0004:	DEC BC LD A,B OR C JR NZ,L0004	Delay about 0.2s to allow screen switching mechanism to settle. [There is no RST \$08. No instruction fetch at \$0008 hence ZX Interface 1 will not be paged in from this ROM. Credit: Paul Farrow].
L000C:	JP L00C7 DEFB \$00, \$00 DEFB \$00, \$00	to the main reset routine. [Spare bytes]

RST \$10 — Print A Character

L0010:	RST 28H DEFW PRINT_A_1 RET	Call corresponding routine in ROM 1. \$0010.
L0014:	DEFB \$00, \$00 DEFB \$00, \$00	[Spare bytes]

RST \$18 — Collect A Character

L0018:	RST 28H DEFW GET_CHAR RET	Call corresponding routine in ROM 1. \$0018.
L001C:	DEFB \$00, \$00 DEFB \$00, \$00	[Spare bytes]

RST \$20 — Collect Next Character

L0020:	RST 28H DEFW NEXT_CHAR RET	Call corresponding routine in ROM 1. \$0020.
L0024:	DEFB \$00, \$00 DEFB \$00, \$00	[Spare bytes]

RST \$28 — Call Routine in ROM 1

RST 28 calls a routine in ROM 1 (or alternatively a routine in RAM while ROM 1 is paged in). Call as follows: RST 28 / DEFW address.

L0028:	EX (SP),HL PUSH AF LD A,(HL) INC HL INC HL LD (RETADDR),HL DEC HL LD H,(HL) LD L,A POP AF JP L005C	Get the address after the RST \$28 into HL, saving HL on the stack. Save the AF registers. Fetch the first address byte. Point HL to the byte after the required address. \$5B5A. Store this in RETADDR. (There is no RST \$30) Fetch the second address byte. HL=Subroutine to call. Restore AF. Jump ahead to continue.
L0037:	DEFB \$00	[Spare byte]

MASKABLE INTERRUPT ROUTINE

This routine preserves the HL register pair. It then performs the following: - Execute the ROM switching code held in RAM to switch to ROM 1.

- Execute the maskable interrupt routine in ROM 1.
- Execute the ROM switching code held in RAM to return to ROM 0.
- Return to address \$0048 (ROM 0).

L0038:	PUSH HL LD HL,\$0048 PUSH HL LD HL,SWAP PUSH HL	Save HL register pair. Return address of \$0048 (ROM 0). \$5B00. Address of swap ROM routine held in RAM at \$5B00.
--------	---	--

SPECTRUM +2 ROM 0 DISASSEMBLY

	LD HL,L0038	Maskable interrupt routine address \$0038 (ROM 0).
	PUSH HL	
	JP SWAP	\$5B00. Switch to other ROM (ROM 1) via routine held in RAM at \$5B00.
L0048:	POP HL	Restore the HL register pair.
	RET	End of interrupt routine.

ERROR HANDLER ROUTINES — PART 1

128K Error Routine

L004A:	LD BC,\$7FFD	
	XOR A	ROM 0, Bank 0, Screen 0, 128K mode.
	DI	Ensure interrupts are disabled whilst paging.
	OUT (C),A	
	LD (BANK_M),A	\$5B5C. Note the new paging status.
	EI	Re-enable interrupts.
	DEC A	A=\$FF.
	LD (IY+\$00),A	Set ERR_NR to no error (\$FF).
	JP L0321	Jump ahead to continue.

RESTART ROUTINES — PART 2

Call ROM 1 Routine (RST \$28 Continuation)

Continuation from routine at \$0028 (ROM 0).

L005C:	LD (TARGET),HL	\$5B58. Save the address in ROM 0 to call.
	LD HL,YOUNGER	\$5B14. HL='Return to ROM 0' routine held in RAM.
	EX (SP),HL	Stack HL.
	PUSH HL	Save previous stack address.
	LD HL,(TARGET)	\$5B58. HL=Retrieve address to call. [There is no NMI code. Credit: Andrew Owen].
	EX (SP),HL	Stack HL.
	JP SWAP	\$5B00. Switch to other ROM (ROM 1) and return to address to call.

RAM ROUTINES

The following code will be copied to locations \$5B00 to \$5B57, within the old ZX Printer buffer.

Swap to Other ROM (copied to \$5B00)

Switch to the other ROM from that currently paged in.

[The switching between the two ROMs invariably enables interrupts, which may not always be desired (see the bug at \$09EC (ROM 0) in the PLAY command). To overcome this issue would require a rewrite of the SWAP routine as follows, but this is larger than the existing routine and so cannot simply be used in direct replacement of it. A work-around solution is to poke a JP instruction at the start of the SWAP routine in the ZX Printer buffer and direct control to the replacement routine held somewhere else in RAM. Credit: Toni Baker, ZX Computing Monthly] [However, the PLAY command bug may be fixed in another manner within the PLAY command itself, in which case there is no need to modify the SWAP routine.]

SWAP:

PUSH AF	Stack AF.
PUSH BC	Stack BC.
LD A,R	P/V flag=Interrupt status.
PUSH AF	Stack interrupt status.
LD BC,\$7FFD	BC=Port number required for paging.
LD A,(BANK_M)	A=Current paging configuration.
XOR \$10	Complement 'ROM' bit.
DI	Disable interrupts (in case an interrupt occurs between the next two instructions).
LD (BANK_M),A	Store revised paging configuration.
OUT (C),A	Page ROM.
POP AF	P/V flag=Former interrupt status.
JP PO,SWAP_EXIT	Jump if interrupts were previously disabled.
EI	Re-enable interrupts.

SWAP_EXIT:

POP BC	Restore BC.
POP AF	Restore AF.
RET	

L006B:

PUSH AF	Save AF and BC.
PUSH BC	
LD BC,\$7FFD	
LD A,(BANK_M)	\$5B5C.
XOR \$10	Select other ROM.
DI	Disable interrupts whilst switching ROMs.
LD (BANK_M),A	\$5B5C.
OUT (C),A	Switch to the other ROM.

SPECTRUM +2 ROM 0 DISASSEMBLY

EI	
POP BC	Restore BC and AF.
POP AF	
RET	

Return to Other ROM Routine (copied to \$5B14)

Switch to the other ROM from that currently paged in and then return to the address held in RETADDR.

YOUNGER

L007F:	CALL SWAP	\$5B00. Toggle to the other ROM.
	PUSH HL	
	LD HL,(RETADDR)	\$5B5A.
	EX (SP),HL	
	RET	Return to the address held in RETADDR.

Error Handler Routine (copied to \$5B1D)

This error handler routine switches back to ROM 0 and then executes the routine pointed to by system variable TARGET.

ONERR

L0088:	DI	Ensure interrupts are disabled whilst paging.
	LD A,(BANK_M)	\$5B5C. Fetch current paging configuration.
	AND \$EF	Select ROM 0.
	LD (BANK_M),A	\$5B5C. Save the new configuration
	LD BC,\$FFD	
	OUT (C),A	Switch to ROM 0.
	EI	
	JP L00C3	Jump to \$00C3 (ROM 0) to continue.

'P' Channel Input Routine (copied to \$5B2F)

Called when data is read from channel 'P'.

It causes ROM 0 to be paged in so that the new RS232 routines can be accessed.

PIN

L009A:	LD HL,L06F7	RS232 input routine within ROM 0.
	JR L00A2	

'P' Channel Output Routine (copied to \$5B34)

Called when data is written to channel 'P'.

It causes ROM 0 to be paged in so that the new RS232 routines can be accessed.

Entry: A=Byte to send.

POUT

L009F:	LD HL,L07E9	RS232 output routine within ROM 0.
L00A2:	EX AF,AF'	Save AF registers.
	LD BC,\$7FFD	
	LD A,(BANK_M)	\$5B5C. Fetch the current paging configuration
	PUSH AF	and save it.
	AND \$EF	Select ROM 0.
	DI	Ensure interrupts are disabled whilst paging.
	LD (BANK_M),A	\$5B5C. Store the new paging configuration.
	OUT (C),A	Switch to ROM 0.
	JP L0605	Jump to the RS232 channel input/output handler
		routine.

'P' Channel Exit Routine (copied to \$5B4A)

Used when returning from a channel 'P' read or write operation.

It causes the original ROM to be paged back in and returns back to the calling routine.

POUT2

L00B5:	EX AF,AF'	Save AF registers. For a read, A holds the byte
		read and the flags the success status.
	POP AF	Retrieve original paging configuration.
	LD BC,\$7FFD	
	DI	Ensure interrupts are disabled whilst paging.
	LD (BANK_M),A	\$5B5C. Store original paging configuration.
	OUT (C),A	Switch back to original paging configuration.
	EI	
	EX AF,AF'	Restore AF registers. For a read, A holds the byte
		read and the flags the success status.
	RET	« End of RAM Routines »

ERROR HANDLER ROUTINES — PART 2

Call Subroutine

Called from ONERR (\$5B1D) to execute the routine pointed

SPECTRUM +2 ROM o DISASSEMBLY

to by system variable SYNRET.

L00C3:	LD HL,(SYNRET) JP (HL)	\$5B8B. Fetch the address to call. and execute it.
--------	---------------------------	---

INITIALISATION ROUTINES — PART 1

Reset Routine (RST \$00 Continuation, Part 1)

Continuation from routine at \$0000 (ROM 0). It performs a test on all RAM banks.
This test is crude and can fail to detect a variety of RAM errors.

L00C7:	LD B,\$08	Loop through all RAM banks.
L00C9:	LD A,B	
	EXX	Save B register.
	DEC A	RAM bank number 0 to 7. 128K mode, ROM 0, Screen 0.
	LD BC,\$7FFD	
	OUT (C),A	Switch RAM bank.
	LD HL,\$C000	Start of the current RAM bank.
	LD DE,\$C001	
	LD BC,\$3FFF	All 16K of RAM bank.
	LD A,\$FF	
	LD (HL),A	Store \$FF into RAM location.
	CP (HL)	Check RAM integrity.
	JR NZ,L0131	Jump if RAM error found.
	XOR A	
	LD (HL),A	Store \$00 into RAM location.
	CP (HL)	Check RAM integrity.
	JR NZ,L0131	Jump if difference found.
	LDIR	Clear the whole page
	EXX	Restore B registers.
	DJNZ L00C9	Repeat for other RAM banks.
	LD (ROW01),A	\$5B88. Signal no communications in progress to the keypad.
	LD C,\$FD	
	LD D,\$FF	
	LD E,\$BF	
	LD B,D	BC=\$FFFD, DE=\$FFBF.
	LD A,\$0E	
	OUT (C),A	Select AY register 14.
	LD B,E	BC=\$BFFD.
	LD A,\$FF	

SPECTRUM +2 ROM 0 DISASSEMBLY

	OUT (C),A	Set AY register 14 to \$FF. This will force a communications reset to the keypad if present.
	JR L0137	Jump ahead to continue.
L00FF:	DEFB \$00	[Spare byte]

ROUTINE VECTOR TABLE

L0100:	JP L17CE	BASIC interpreter parser.
L0103:	JP L1857	'Line Run' entry point.
L0106:	JP L1EEE	Transfer bytes to logical RAM bank 4.
L0109:	JP L1F23	Transfer bytes from logical RAM bank 4.
L010C:	JP L004A	128K error routine.
L010F:	JP L03A2	Error routine. Called from patch at \$3B3B in ROM 1.
L0112:	JP L1849	'Statement Return' routine. Called from patch at \$3B4D in ROM 1.
L0115:	JP L18C7	'Statement Next' routine. Called from patch at \$3B5D in ROM 1.
L0118:	JP L012D	Scan the keypad.
L011B:	JP L0A24	Play music strings.
L011E:	JP L11C2	MIDI byte output routine.
L0121:	JP L06F7	RS232 byte input routine.
L0124:	JP L07E9	RS232 text output routine.
L0127:	JP L08C2	RS232 byte output routine.
L012A:	JP L090F	COPY (screen dump) routine.
L012D:	RST 28H	Call keypad scan routine in ROM 1.
	DEFW KP_SCAN-\$0100	\$3B01. [BUG] - The address jumps into the middle of the keypad decode routine in ROM 1. It looks like it is supposed to deal with the keypad and so the most likely addresses are \$3A42 (read keypad) or \$39A0 (scan keypad). At \$3C01 in ROM 1 is a vector jump command to \$39A0 to scan the keypad and this is similar enough to the \$3B01 to imply a simple error in one of the bytes. Credit: Paul Farrow]
	RET	

INITIALISATION ROUTINES — PART 2

Fatal RAM Error

Set the border colour to indicate which RAM bank was found faulty: RAM bank 7 - Black.
RAM bank 6 - White.

SPECTRUM +2 ROM 0 DISASSEMBLY

RAM bank 5 - Yellow.
RAM bank 4 - Cyan.
RAM bank 3 - Green.
RAM bank 2 - Magenta.
RAM bank 1 - Red.
RAM bank 0 - Blue.

L0131:	EXX LD A,B OUT (\$FE),A	Retrieve RAM bank number + 1 in B. Indicate which RAM bank failed by setting the border colour.
L0135:	JR L0135	Infinite loop.

Reset Routine (RST \$00 Continuation, Part 2)

Continuation from routine at \$00C7 (ROM 0).

L0137:	LD B,D LD A,\$07 OUT (C),A LD B,E LD A,\$FF OUT (C),A LD DE,SWAP LD HL,L006B LD BC,\$0058 LDIR LD A,\$CF LD (RAMRST),A LD SP,TSTACK LD A,\$04 CALL L1C83 LD IX,\$EBEC LD (SFNEXT),IX LD (IX+\$0A),\$00 LD (IX+\$0B),\$C0 LD (IX+\$0C),\$00 LD HL,\$2BEC LD A,\$01 LD (SFSPACE),HL LD (SFSPACE+2),A	Complete setting up the sound chip registers. Select AY register 7. Disable AY-3-8912 sound channels. \$5B00. Copy the various paging routines to the old printer buffer. The source is in this ROM. There are eighty eight bytes to copy. Copy the block of bytes. Load A with the code for the Z80 instruction 'RST \$08'. \$5B5D. Insert into new System Variable RAMRST. \$5BFF. Set the stack pointer to last location of old buffer. Page in logical RAM bank 4 (physical RAM bank 7). First free entry in RAM disk. \$5B83. AHL=Free space in RAM disk. \$5B85. Current address. \$5B87. Current RAM bank.
--------	---	---

SPECTRUM +2 ROM o DISASSEMBLY

LD A,\$05	
CALL L1C83	Page in logical RAM bank 5 (physical RAM bank 0).
LD HL,\$FFFF	Load HL with known last working byte - 65535.
LD (\$5CB4),HL	P_RAMT. Set physical RAM top to 65535.
LD DE,CHAR_SET+\$01AF	\$3EAF. Set DE to address of the last bitmap of 'U' in ROM 1.
LD BC,\$00A8	There are 21 User Defined Graphics to copy.
EX DE,HL	Swap so destination is \$FFFF.
RST 28H	
DEFW MAKE_ROOM+\$000C	Calling this address (LDDR/RET) in the main ROM cleverly copies the 21 characters to the end of RAM.
EX DE,HL	Transfer DE to HL.
INC HL	Increment to address first byte of UDG 'A'.
LD (\$5C7B),HL	UDG. Update standard System Variable UDG.
DEC HL	
LD BC,\$0040	Set values 0 for PIP and 64 for RASP.
LD (\$5C38),BC	RASP. Update standard System Variables RASP and PIP.
LD (\$5CB2),HL	RAMTOP. Update standard System Variable RAMTOP - the last byte of the BASIC system area. Any machine code and graphics above this address are protected from NEW.

Entry point for NEW with interrupts disabled and physical RAM bank 0 occupying the upper RAM region \$C000 - \$FFFF, i.e. the normal BASIC memory configuration.

L019D:	LD HL,CHAR_SET-\$0100	\$3C00. Set HL to where, in theory character zero would be.
	LD (\$5C36),HL	CHARS. Update standard System Variable CHARS.
	LD HL,(\$5CB2)	RAMTOP. Load HL with value of System Variable RAMTOP.
	INC HL	Address next location.
	LD SP,HL	Set the Stack Pointer.
	IM 1	Select Interrupt Mode 1.
	LD IY,\$5C3A	Set the IY register to address the standard System Variables and many of the new System Variables and even those of ZX Interface 1 in some cases.
	SET 4,(IY+\$01)	FLAGS. Signal 128K mode. [This bit was unused and therefore never set by 48K BASIC]
	EI	With a stack and the IY register set, interrupts can be enabled.
	LD HL,\$000B	Set HL to eleven, timing constant for 9600 baud.

SPECTRUM +2 ROM o DISASSEMBLY

LD (BAUD),HL	\$5B5F. Select default RS232 baud rate of 9600 baud.
XOR A	Clear accumulator.
LD (SERFL),A	\$5B61. Indicate no byte waiting in RS232 receive buffer.
LD (COL),A	\$5B63. Set RS232 output column position to 0.
LD (TVPARS),A	\$5B65. Indicate no control code parameters expected.
LD HL,\$EC00	[BUG - Should write to RAM bank 7. Main RAM has now been corrupted. The value stored is subsequently never used. Credit: Geoff Wearmouth]
LD (\$FF24),HL	This is a remnant from the Spanish 128, which used this workspace variable to hold the location of the Screen Buffer, but it also suffered from this bug. In fact there was never a need to write to the value at this point since it is written again later during the initialisation process. [The 1985 Sinclair Research ESPAGNOL source code says that this instruction will write to the (previously cleared) main BASIC RAM during initialization but that a different page of RAM will be present during NEW. Stuff and Nonsense! Assemblers and other utilities present above RAMTOP will be corrupted by the BASIC NEW command since \$FF24, and later \$EC13, will be written to even if they are above RAMTOP.]
LD A,\$50	Default to a printer width of 80 columns.
LD (WIDTH),A	\$5B64. Set RS232 printer output width.
LD HL,\$000A	Use 10 as the initial renumber line and increment.
LD (RNFIRST),HL	\$5B94. Store the initial line number when renumbering.
LD (RNSTEP),HL	\$5B96. Store the renumber line increment.
LD HL,\$5CB6	Address after the System Variables.
LD (\$5C4F),HL	CHANS. Set the default location for the channel area.
LD DE,L05A8	Point to Initial Channel Information in this ROM. This is similar to that in main ROM but channel 'P' has input and output addresses in the new \$5Bxx region.
LD BC,\$0015	There are 21 bytes to copy.
EX DE,HL	Switch pointer so destination is CHANS.
LDIR	Copy the block of bytes.
EX DE,HL	
DEC HL	Decrement to point to channel information end-marker.

SPECTRUM +2 ROM o DISASSEMBLY

LD (\$5C57),HL	DATADD. Set the default address of the terminator for the last DATA item.
INC HL	
LD (\$5C53),HL	PROG. Set the default address of the BASIC program area.
LD (\$5C4B),HL	VARs. Set the default address of the BASIC variables area.
LD (HL),\$80	Insert the Variables end-marker.
INC HL	
LD (\$5C59),HL	E_LINE. Set the default address of the editing line area.
LD (HL),\$0D	Insert a carriage return.
INC HL	
LD (HL),\$80	Insert the editing line end-marker.
INC HL	
LD (\$5C61),HL	WORKSP. Set the address of the workspace.
LD (\$5C63),HL	STKBOT. Set the address of the start of the calculator stack.
LD (\$5C65),HL	STKEND. Set the address of the end of the calculator stack.
LD A,\$38	Attribute colour of black ink on white paper.
LD (\$5C8D),A	ATTR_P. Set the permanent attribute colour.
LD (\$5C8F),A	MASK_P. Set the permanent attribute mask.
LD (\$5C48),A	BORDCR. Set the default border colour.
XOR A	
LD (\$EC13),A	Temporary P_FLAG. Clear the temporary store for P-FLAG. [BUG - Should write this to RAM bank 7. Main RAM has now been corrupted again. The effect of the bug can be seen by typing INVERSE 1: PRINT "Hello", followed by NEW, followed by PRINT "World", and will cause the second word to also be printed in inverse. Credit: Geoff Wearmouth]
LD A,\$07	
OUT (\$FE),A	Set the border white.
LD HL,\$0523	The values five and thirty five.
LD (\$5C09),HL	REPDEL. Set the default values for key delay and key repeat.
DEC (IY-\$3A)	Set KSTATE+0 to \$FF.
DEC (IY-\$36)	Set KSTATE+4 to \$FF.
LD HL,L05BD	Address of the Initial Stream Data within this ROM (which is identical to that in main ROM).
LD DE,\$5C10	STRMS. Address of the system variable holding the channels attached to streams data.
LD BC,\$000E	
LDIR	Initialise the streams system variables.
RES 1,(IY+\$01)	FLAGS. Signal printer not is use.

SPECTRUM +2 ROM o DISASSEMBLY

LD (IY+\$00),\$FF	ERR_NR. Signal no error.
LD (IY+\$31),\$02	DF_SZ. Set the lower screen size to two rows.
RST 28H	
DEFW CLS	\$0D6B. Clear the screen.
RST 28H	Attempt to display TV tuning test screen.
DEFW TEST_SCREEN	\$3C04. Will return if BREAK is not being pressed.
LD DE,L0561	Address of the Sinclair copyright message.
CALL L059C	Display the copyright message.
LD (IY+\$31),\$02	DF_SZ. Set the lower screen size to two rows.
SET 5,(IY+\$02)	TV_FLAG. Signal lower screen will require clearing.
LD HL,TSTACK	\$5BFF.
LD (OLDSP),HL	\$5B81. Use the temporary stack as the previous stack.
CALL L1F64	Use Workspace RAM configuration (physical RAM bank 7).
LD A,\$38	Set colours to black ink on white paper.
LD (\$EC11),A	Temporary ATTR_T used by the 128 BASIC Editor.
LD (\$EC0F),A	Temporary ATTR_P used by the 128 BASIC Editor.

[Note this is where \$EC13 (temporary P_FLAG) and \$FF24 should be set]

CALL L25A3	Initialise mode and cursor settings. IX will point at editing settings information.
CALL L1F3F	Use Normal RAM Configuration (physical RAM bank 0).
JP L25BE	Jump to show the Main menu.

COMMAND EXECUTION ROUTINES — PART 1

Execute Command Line

A typed in command resides in the editing workspace. Execute it.

The command could either be a new line to insert, or a line number to delete, or a numerical expression to evaluate.

L026B:	LD HL,FLAGS3	\$5B66.
	SET 0,(HL)	Select BASIC/Calculator mode.
	LD (IY+\$00),\$FF	ERR_NR. Set to '0 OK' status.
	LD (IY+\$31),\$02	DF_SZ. Reset the number of rows in the lower screen.
	LD HL,ONERR	\$5B1D. Return address should an error occur.

SPECTRUM +2 ROM 0 DISASSEMBLY

PUSH HL	Stack it.
LD (\$5C3D),SP	Save the stack pointer in ERR_SP.
LD HL,L02BA	Return address in ROM 0 after syntax checking.
LD (SYNRET),HL	\$5B8B. Store it in SYNRET.
CALL L22AD	Point to start of typed in BASIC command.
CALL L22EA	Is the first character a function token, i.e. the start of a numerical expression?
JP Z,L2217	Jump if so to evaluate it.
CP '('	\$28. Is the first character the start of an expression?
JP Z,L2217	Jump if so to evaluate it.
CP '-'	\$2D. Is the first character the start of an expression?
JP Z,L2217	Jump if so to evaluate it.
CP '+'	\$2B. Is the first character the start of an expression?
JP Z,L2217	Jump if so to evaluate it.
CALL L22FF	Is text just a number or a numerical expression?
JP Z,L2217	Jump if a numerical expression to evaluate it.
CALL L1F64	Use Workspace RAM configuration (physical RAM bank 7).
LD A,(\$EC0E)	Fetch mode.
CALL L1F3F	Use Normal RAM Configuration (physical RAM bank 0).
CP \$04	Calculator mode?
JP NZ,L17CE	Jump if not to parse and execute the BASIC command line, returning to \$02BA (ROM 0).

Calculator mode

CALL L22B6	Is it a single LET command?
JP Z,L17CE	Jump if so to parse and execute the BASIC command line, returning to \$02BA (ROM 0).

Otherwise ignore the command

POP HL	Drop ONERR return address.
RET	

Return from BASIC Line Syntax Check

This routine is returned to when a BASIC line has been syntax checked.

L02BA:	BIT 7,(IY+\$00)	Test ERR_NR.
	JR NZ,L02C1	Jump ahead if no error.

SPECTRUM +2 ROM o DISASSEMBLY

RET	Simply return if an error.
-----	----------------------------

The syntax check was successful, so now proceed to parse the line for insertion or execution

L02C1:	LD HL,(\$5C59)	ELINE. Point to start of editing area.
	LD (\$5C5D),HL	Store in CH_ADD.
	RST 28H	
	DEFW E_LINE_NO	\$19FB. Call E_LINE_NO in ROM 1 to read the line number into editing area.
	LD A,B	
	OR C	
	JP NZ,L03F7	Jump ahead if there was a line number.

Parse a BASIC Line with No Line Number

	RST 18H	Get character.
	CP \$0D	End of the line reached, i.e. no BASIC statement?
	RET Z	Return if so.
	CALL L220E	Clear screen if it requires it.
	BIT 6,(IY+\$02)	TVFLAG. Clear lower screen?
	JR NZ,L02DF	Jump ahead if no need to clear lower screen.
	RST 28H	
L02DF:	DEFW CLS_LOWER	\$0D6E. Clear the lower screen.
	RES 6,(IY+\$02)	TVFLAG. Signal to clear lower screen.
	CALL L1F64	Use Workspace RAM configuration (physical RAM bank 7).
	LD HL,\$EC0D	Editor flags.
	BIT 6,(HL)	Using lower screen area for editing?
	JR NZ,L02F4	Jump ahead if so.
	INC HL

	CP \$00	In Edit Menu mode?
	CALL Z,L38A2	If so then clear lower editing area display.
L02F4:	CALL L1F3F	Use Normal RAM Configuration (physical RAM bank 0).
	LD HL,\$5C3C	TVFLAG.
	RES 3,(HL)	Signal mode has not changed.
	LD A,\$19	25.
	SUB (IY+\$4F)	S_POSN+1. Subtract the current print row position.
	LD (\$5C8C),A	SCR_CT. Set the number of scrolls.
	SET 7,(IY+\$01)	FLAGS. Not syntax checking.
	LD (IY+\$0A),\$01	NSPPC. Set line to be jumped to as line 1.

SPECTRUM +2 ROM 0 DISASSEMBLY

[BUG - Whenever a typed in command is executed directly from the editing workspace, a new GO SUB marker is set up on the stack. Any existing GO SUB calls that were on the stack are lost and as a result attempting to continue the program (without the use of CLEAR or RUN) will likely lead to a "7 RETURN without GOSUB" error report message being displayed. However, the stack marker will already have been lost due to the error handler routine at \$0321. The first action it does is to reset the stack pointer to point to the location of RAMTOP, i.e. after the GO SUB marker. This is why it is necessary for a new GO SUB marker needs to be set up. Credit: Michal Skrzypek]

LD HL,\$3E00	The end of GO SUB stack marker.
PUSH HL	Place it on the stack.
LD HL,ONERR	\$5B1D. The return address should an error occur.
PUSH HL	Place it on the stack.
LD (\$5C3D),SP	ERR_SP. Store error routine address.
LD HL,L0321	Address of error handler routine in ROM 0.
LD (SYNRET),HL	\$5B8B. Store it in SYNRET.
JP L1857	Jump ahead to the main parser routine to execute the line.

ERROR HANDLER ROUTINES — PART 3

Error Handler Routine

[BUG - Upon terminating a BASIC program, either via reaching the end of the program or due to an error occurring, execution is passed to this routine. The first action it does is to reset the stack pointer to point to the location of RAMTOP, i.e. after the GO SUB marker. However, this means that any existing GO SUB calls that were on the stack are lost and so attempting to continue the program (without the use of CLEAR or RUN) will likely lead to a "7 RETURN without GOSUB" error report message being displayed. When a new typed in command is executed, the code at \$030C sets up a new GO SUB marker on the stack. Credit: Michal Skrzypek]

L0321:	LD SP,(\$5CB2)	RAMTOP.
	INC SP	Reset SP to top of memory map.
	LD HL,TSTACK	\$5BFF.
	LD (OLDSP),HL	\$5B81. Use the temporary stack as the previous stack.
	HALT	Trap error conditions where interrupts are disabled.
	RES 5,(IY+\$01)	FLAGS. Signal no new key.
	LD HL,FLAGS3	\$5B66.
	BIT 2,(HL)	Editing RAM disk catalogue?
	JR Z,L034A	Jump if not.
	CALL L1F64	Use Workspace RAM configuration (physical RAM bank 7).
	LD IX,(SFNEXT)	\$5B83.

SPECTRUM +2 ROM o DISASSEMBLY

LD BC,\$0014	Catalogue entry size.
ADD IX,BC	Remove last entry.
CALL L1D75	Update catalogue entry (leaves logical RAM bank 4 paged in).
CALL L1F3F	Use Normal RAM Configuration (physical RAM bank 0).

Display error code held in ERR_NR

L034A:	LD A,(\$5C3A)	Fetch error number from ERR_NR.
	INC A	Increment to give true error code.
L034E:	PUSH AF	Save the error code.
	LD HL,\$0000	
	LD (IY+\$37),H	FLAGX. Ensure not INPUT mode.
	LD (IY+\$26),H	X_PTR_hi. Clear to suppress error '?' marker.
	LD (\$5C0B),HL	DEFADD. Clear to signal no defined function is currently being evaluated.
	LD HL,\$0001	[Could have saved 2 bytes by using INC L].
	LD (\$5C16),HL	STRMS+\$0006. Ensure STRMS-00 specifies the keyboard.
	RST 28H	
	DEFW SET_MIN	\$16B0. Clears editing area and areas after it.
	RES 5,(IY+\$37)	FLAGX. Signal not INPUT mode. [Redundant since all flags were reset earlier]
	RST 28H	
	DEFW CLS_LOWER	\$0D6E. Clear lower editing screen.
	SET 5,(IY+\$02)	TVFLAG. Signal lower screen requires clearing.
	POP AF	Retrieve error code.
	LD B,A	Store error code in B.
	CP \$0A	Is it a numeric error code (1-9), i.e. suitable for immediate display?
	JR C,L037F	If so jump ahead to display it.
	CP \$1D	Is it one of the standard errors (A-R)?
	JR C,L037D	If so jump ahead to convert it into an upper case letter.
	ADD A,\$14	Otherwise convert it into a lower case letter.
	JR L037F	Jump ahead to display it. [Could have saved 2 bytes by using ADD A,\$0C instead of these two instructions]
L037D:	ADD A,\$07	Increase code to point to upper case letters.
L037F:	RST 28H	
	DEFW OUT_CODE	\$15EF. Display the character held in the A register.
	LD A,\$20	Display a space.
	RST 10H	
	LD A,B	Retrieve the error code.
	CP \$1D	Is it one of the standard errors (A-R)?

SPECTRUM +2 ROM o DISASSEMBLY

JR C,L039C

Jump if an standard error message (A-R).

Display a new error message

[Note that there is no test to range check the error code value and therefore whether a message exists for it. Poking directly to system variable ERR_NR with an invalid code (43 or above) will more than likely cause a crash]

SUB \$1D
LD B,\$00
LD C,A

Select the first message ", " (a 'comma' and a 'space').

\$1536. Message base address in ROM 1.

Print a comma followed by a space.

PPC. Fetch current line number.

\$1A1B. Print the line number.

Print ':'.

SUBPPC. Fetch current statement number.

\$1A1B. Print the statement number.

\$1097. Clear editing and workspace areas.

ERR_NR. Fetch the error code.

Jump ahead for "0 OK".

SPECTRUM +2 ROM o DISASSEMBLY

	CP \$09	
	JR Z,L03CC	Jump for "A Invalid argument", thereby advancing to the next statement.
	CP \$15	
	JR NZ,L03CF	Jump unless "M Ramtop no good".
L03CC:	INC (IY+\$0D)	SUBPPC. Advance to the next statement.
L03CF:	LD BC,\$0003	
	LD DE,\$5C70	OSPPC. Continue statement number.
	LD HL,\$5C44	NSPPC. Next statement number.
	BIT 7,(HL)	Is there a statement number?
	JR Z,L03DD	Jump if so.
	ADD HL,BC	HL=SUBPPC. The current statement number.
L03DD:	LDDR	Copy SUBPPC and PPC to OSPPC and OLDPPC, for use by CONTINUE.
L03DF:	LD (IY+\$0A),\$FF	NSPPC. Signal no current statement number.
	RES 3,(IY+\$01)	FLAGS. Select K-Mode.
	LD HL,FLAGS3	\$5B66.
	RES 0,(HL)	Select 128 Editor mode.
	JP L25EA	Jump ahead to return control to the Editor.

Error Handler Routine When Parsing BASIC Line

L03EF:	LD A,\$10	Error code 'G - No room for line'.
	LD BC,\$0000	
	JP L034E	Jump to print the error code.

COMMAND EXECUTION ROUTINES — PART 2

Parse a BASIC Line with a Line Number

This routine handles insertion of a BASIC line specified with a line number, or just a line number specified on its own, i.e. delete the line.

L03F7:	LD (\$5C49),BC	E_PPC. Store the line as the current line number with the program cursor.
	CALL L1F64	Use Workspace RAM configuration (physical RAM bank 7).
	LD A,B	[This test could have been performed before paging in bank 7 and hence could have benefited from a slight speed improvement.
	OR C	The test is redundant since BC holds a non-zero line number]

SPECTRUM +2 ROM o DISASSEMBLY

	JR Z,L040A	Jump if no line number.
	LD (\$5C49),BC	E_PPC. Current edit line number. [Redundant instruction - Line number has already been stored]
L040A:	LD (\$EC08),BC	Temporary E_PPC used by BASIC Editor.
	CALL L1F3F	Use Normal RAM Configuration (physical RAM bank 0).
	LD HL,(\$5C5D)	CH_ADD. Point to the next character in the BASIC line.
	EX DE,HL	
	LD HL,L03EF	Address of error handler routine should there be no room for the line.
	PUSH HL	Stack it.
	LD HL,(\$5C61)	WORKSP.
	SCF	
	SBC HL,DE	HL=Length of BASIC line.
	PUSH HL	Stack it.
	LD H,B	
	LD L,C	Transfer edit line number to HL.
	RST 28H	
	DEFW LINE_ADDR	\$196E. Returns address of the line in HL.
	JR NZ,L0429	Jump if the line does not exist.

The line already exists so delete it

	RST 28H	
	DEFW NEXT_ONE	\$19B8. Find the address of the next line.
	RST 28H	
	DEFW RECLAIM_2	\$19E8. Delete the line.
L0429:	POP BC	BC=Length of the BASIC line.
	LD A,C	
	DEC A	Is it 1, i.e. just an 'Enter' character, and hence only
	OR B	a line number was entered?
	JR NZ,L0442	Jump if there is a BASIC statement.

Just a line number entered. The requested line has already been deleted so move the program cursor to the next line

	CALL L1F64	Use Workspace RAM configuration (physical RAM bank 7).
	PUSH HL	Save the address of the line.
	LD HL,(\$5C49)	E_PPC. Fetch current edit line number.
	CALL L3370	Find closest line number (or \$0000 if no line).
	LD (\$5C49),HL	E_PPC. Store current edit line number. Effectively refresh E_PPC.

SPECTRUM +2 ROM o DISASSEMBLY

	POP HL	HL=Address of the line.
	CALL L1F3F	Use Normal RAM Configuration (physical RAM bank 0).
L0442:	JR L046A	Jump ahead to exit.
	PUSH BC	BC=Length of the BASIC line. Stack it.
	INC BC	
	INC BC	
	INC BC	
	INC BC	BC=BC+4. Allow for line number and length bytes.
	DEC HL	Point to before the current line, i.e. the location to insert bytes at.
	LD DE,(\$5C53)	PROG. Get start address of the BASIC program.
	PUSH DE	Stack it.
	RST 28H	
	DEFW MAKE_ROOM	\$1655. Insert BC spaces at address HL.
	POP HL	HL=Start address of BASIC program.
	LD (\$5C53),HL	PROG. Save start address of BASIC program.
	POP BC	BC=Length of the BASIC line.
	PUSH BC	
	INC DE	Point to the first location of the newly created space.
	LD HL,(\$5C61)	WORKSP. Address of end of the BASIC line in the workspace.
	DEC HL	
	DEC HL	Skip over the newline and terminator bytes.
	LDDR	Copy the BASIC line from the workspace into the program area.
	LD HL,(\$5C49)	E_PPC. Current edit line number.
	EX DE,HL	
	POP BC	BC=Length of BASIC line.
	LD (HL),B	Store the line length.
	DEC HL	
	LD (HL),C	
	DEC HL	
	LD (HL),E	DE=line number.
	DEC HL	
	LD (HL),D	Store the line number.
L046A:	POP AF	Drop item (address of error handler routine).
	RET	Exit with HL=Address of the line.

ERROR HANDLER ROUTINES — PART 4

New Error Message Vector Table

Pointers into the new error message table.

L046C:	DEFW L048C	Error report 'a'.
	DEFW L0497	Error report 'b'.
	DEFW L04A6	Error report 'c'.
	DEFW L04B0	Error report 'd'.
	DEFW L04C1	Error report 'e'.
	DEFW L04D4	Error report 'f'.
	DEFW L04E0	Error report 'g'.
	DEFW L04E0	Error report 'h'.
	DEFW L04F3	Error report 'i'.
	DEFW L0501	Error report 'j'.
	DEFW L0512	Error report 'k'.
	DEFW L0523	Error report 'l'.
	DEFW L0531	Error report 'm'.
	DEFW L0542	Error report 'n'.
	DEFW L054E	Error report 'o'.
	DEFW L0561	Error report 'p'.

New Error Message Table

L048C:	DEFM "MERGE erro"	Report 'a'.
	DEFB 'r'+\$80	
L0497:	DEFM "Wrong file typ"	Report 'b'.
	DEFB 'e'+\$80	
L04A6:	DEFM "CODE erro"	Report 'c'.
	DEFB 'r'+\$80	
L04B0:	DEFM "Too many bracket"	Report 'd'.
	DEFB 's'+\$80	
L04C1:	DEFM "File already exist"	Report 'e'.
	DEFB 's'+\$80	
L04D4:	DEFM "Invalid nam"	Report 'f'.
	DEFB 'e'+\$80	
L04E0:	DEFM "File does not exis"	Report 'g' & 'h'.
	DEFB 't'+\$80	
L04F3:	DEFM "Invalid devic"	Report 'i'.
	DEFB 'e'+\$80	
L0501:	DEFM "Invalid baud rat"	Report 'j'.

SPECTRUM +2 ROM o DISASSEMBLY

L0512:	DEFB 'e'+\$80	
	DEFM "Invalid note nam"	Report 'k'.
	DEFB 'e'+\$80	
L0523:	DEFM "Number too bi"	Report 'l'.

	Consumer"	
	DEFB \$0D	
	DEFM " Electronics pl"	
	DEFB 'c'+\$80	

Print Message

Print a message which is terminated by having bit 7 set, pointed at by DE.

L059C:	LD A,(DE)	Fetch next byte.
	AND \$7F	Mask off top bit.
	PUSH DE	Save address of current message byte.
	RST 10H	Print character.
	POP DE	Restore message byte pointer.
	LD A,(DE)	
	INC DE	
	ADD A,A	Carry flag will be set if byte is \$FF.
	JR NC,L059C	Else print next character.
	RET	

INITIALISATION ROUTINES — PART 3

The 'Initial Channel Information'

Initially there are four channels ('K', 'S', 'R', & 'P') for communicating with the 'keyboard', 'screen', 'work space' and 'printer'.

For each channel the output routine address comes before the input routine address and the channel's code.

SPECTRUM +2 ROM 0 DISASSEMBLY

This table is almost identical to that in ROM 1 at \$15AF but with changes to the channel P routines to use the RS232 port instead of the ZX Printer.
Used at \$01DD (ROM 0).

L05A8:	DEFW PRINT_OUT	\$09F4 - K channel output routine.
	DEFW KEY_INPUT	\$10A8 - K channel input routine.
	DEFB 'K'	\$4B - Channel identifier 'K'.
	DEFW PRINT_OUT	\$09F4 - S channel output routine.
	DEFW REPORT_J	\$15C4 - S channel input routine.
	DEFB 'S'	\$53 - Channel identifier 'S'.
	DEFW ADD_CHAR	\$0F81 - R channel output routine.
	DEFW REPORT_J	\$15C4 - R channel input routine.
	DEFB 'R'	\$52 - Channel identifier 'R'.
	DEFW POUT	\$5B34 - P Channel output routine.
	DEFW PIN	\$5B2F - P Channel input routine.
	DEFB 'P'	\$50 - Channel identifier 'P'.
	DEFB \$80	End marker.

The 'Initial Stream Data'

Initially there are seven streams - \$FD to \$03.
This table is identical to that in ROM 1 at \$15C6.
Used at \$0226 (ROM 0).

L05BD:	DEFB \$01, \$00	Stream \$FD leads to channel 'K'.
	DEFB \$06, \$00	Stream \$FE leads to channel 'S'.
	DEFB \$0B, \$00	Stream \$FF leads to channel 'R'.
	DEFB \$01, \$00	Stream \$00 leads to channel 'K'.
	DEFB \$01, \$00	Stream \$01 leads to channel 'K'.
	DEFB \$06, \$00	Stream \$02 leads to channel 'S'.
	DEFB \$10, \$00	Stream \$03 leads to channel 'P'.

ERROR HANDLER ROUTINES — PART 5

Produce Error Report

L05CB:	POP HL	Point to the error byte.
	LD BC,\$7FFD	
	XOR A	ROM 0, Screen 0, Bank 0, 128 mode.
	DI	Ensure interrupts disable whilst paging.
	LD (BANK_M),A	\$5B5C. Store new state in BANK_M.
	OUT (C),A	Switch to ROM 0.

SPECTRUM +2 ROM 0 DISASSEMBLY

EI	
LD SP,(\$5C3D)	Restore SP from ERR_SP.
LD A,(HL)	Fetch the error number.
LD (RAMERR),A	\$5B5E. Store the error number.
INC A	
CP \$1E	[BUG - This should be \$1D. As such, error code 'a' will be diverted to ROM 1 for handling. Credit: Paul Farrow]
JR NC,L05E7	Jump if not a standard error code.

Handle a standard error code

RST 28H	
DEFW RAMRST	\$5B5D. Call the error handler routine in ROM 1.

Handle a new error code

L05E7:	DEC A	
	LD (IY+\$00),A	Store in ERR_NR.
	LD HL,(\$5C5D)	CH_ADD.
	LD (\$5C5F),HL	X_PTR. Set up the address of the character after the '?' marker.
	RST 28H	
	DEFW SET_STK	\$16C5. Set the calculator stack.
	RET	Return to the error routine.

Check for BREAK into Program

L05F5:	LD A,\$7F	Read keyboard row B - SPACE.
	IN A,(\$FE)	
	RRA	Extract the SPACE key.
	RET C	Return if SPACE not pressed.
	LD A,\$FE	Read keyboard row CAPS SHIFT - V.
	IN A,(\$FE)	
	RRA	Extract the CAPS SHIFT key.
	RET C	Return if CAPS SHIFT not pressed.
	CALL L05CB	Produce an error.
	DEFB \$14	"L Break into program"

RS232 PRINTER ROUTINES

RS232 Channel Handler Routines

This routine handles input and output RS232 requested. It is similar to the routine in the ZX Interface 1 ROM at \$0D5A, but in that ROM the routine is only used for input.

L0605:	EI	Enabled interrupts.
	EX AF,AF'	Save AF registers.
	LD DE,POUT2	\$5B4A. Address of the RS232 exit routine held in RAM.
	PUSH DE	Stack it.
	RES 3,(IY+\$02)	TVFLAG. Indicate not automatic listing.
	PUSH HL	Save the input/output routine address.
	LD HL,(\$5C3D)	Fetch location of error handler routine from ERR_SP.
	LD E,(HL)	
	INC HL	
	LD D,(HL)	DE=Address of error handler routine.
	AND A	
	LD HL,ED_ERROR	\$107F in ROM 1.
	SBC HL,DE	
	JR NZ,L0656	Jump if error handler address is different, i.e. due to INKEY\$# or PRINT\$#.

Handle INPUT#

	POP HL	Retrieve the input/output routine address.
	LD SP,(\$5C3D)	ERR_SP.
	POP DE	Discard the error handler routine address.
	POP DE	Fetch the original address of ERR_SP (this was stacked at the beginning of the INPUT routine in ROM 1).
	LD (\$5C3D),DE	ERR_SP.
L0629:	PUSH HL	Save the input/output routine address.
	LD DE,L062F	Address to return to.
	PUSH DE	Stack the address.
	JP (HL)	Jump to the RS232 input/output routine.

Return here from the input/output routine

L062F:	JR C,L063A	Jump if a character was received.
	JR Z,L0637	Jump if a character was not received.
L0633:	CALL L05CB	Produce an error "8 End of file".

SPECTRUM +2 ROM o DISASSEMBLY

DEFB \$07

A character was not received

L0637:	POP HL JR L0629	Retrieve the input routine address. Jump back to await another character.
--------	--------------------	--

A character was received

L063A:	CP \$0D JR Z,L064C LD HL,(RETADDR) PUSH HL RST 28H DEFW ADD_CHAR+4 POP HL LD (RETADDR),HL POP HL JR L0629	Is it a carriage return? Jump ahead if so. \$5B5A. Fetch the return address. \$0F85. Insert the character into the INPUT line. \$5B5A. Restore the return address. Retrieve the input routine address. Jump back to await another character.
--------	--	--

Enter was received so end reading the stream

L064C:	POP HL LD A,(BANK_M) OR \$10 PUSH AF JP POUT2	Discard the input routine address. \$5B5C. Fetch current paging configuration. Select ROM 1. Stack the required paging configuration. \$5B4A. Exit.
--------	---	---

Handle INKEY\$# and PRINT#

L0656:	POP HL LD DE,L065C PUSH DE JP (HL)	Retrieve the input/output routine address. Stack the return address. Jump to input or output routine.
--------	---	---

Return here from the input/output routine. When returning from the output routine, either the carry or zero flags should always be set to avoid the false generation of error report "8 End of file" [though this is not always the case - see bugs starting at \$088B (ROM 0)].

L065C:	RET C RET Z JR L0633	Return if a character was received. Return if a character was not received or was written. Produce error report "8 End of file".
--------	--------------------------------	--

FORMAT Routine

The format command sets the RS232 baud rate, e.g. FORMAT "P"; 9600.

It attempts to match against one of the supported baud rates, or uses the next higher baud rate if a non-standard value is requested. The maximum baud rate supported is 9600, and this is used for any rates specified that are higher than this.

RS232 Output Routine

This routine handles control codes, token expansion, graphics and UDGs. It therefore cannot send binary data and hence cannot support EPSON format ESC control codes [Credit: Andrew Owen].

The routine suffers from a number of bugs as described in the comments below. It also suffers from a minor flaw in the design, which prevents interlacing screen and printer control codes and their parameters. For example, the following will not work correctly: 10 LPRINT CHR\$ 16

20 PRINT AT 0,0

30 LPRINT CHR\$ 0;"ABC"

The control byte 16 gets stored in TVDATA so that the system knows how to interpret its parameter byte. However, the AT control code 22 in line 20 will overwrite it. When line 30 is executed, TVDATA still holds the control code for 'AT' and so this line is interpreted as PRINT AT instead of PRINT INK. [Credit: Ian Collier (+3)]

Entry: A=character to output.

	DEFB \$1B, \$32	ESC '2' - 1/6 inch line spacing.

PLAY COMMAND ROUTINES

Up to 3 channels of music/noise are supported by the AY-3-8912 sound generator.

Up to 8 channels of music can be sent to support synthesisers, drum machines or sequencers via the MIDI interface, with the first 3 channels also played by the AY-3-8912 sound generator. For each channel of music, a MIDI channel can be assigned to it using the 'Y' command.

The PLAY command reserves and initialises space for the PLAY command. This comprises a block of \$003C bytes used to manage the PLAY command (IY points to this command data block) and a block of \$0037 bytes for each channel string (IX is used to point to the channel data block for the current channel). [Note that the command data block is \$04 bytes larger than it needs to be, and each channel data block is \$11 bytes larger than it needs to be]

Entry: B=The number of strings in the PLAY command (1..8).

Command Data Block Format

IY+\$00 / IY+\$01 Channel 0 data block pointer. Points to the data for channel 0 (string 1).

IY+\$02 / IY+\$03 Channel 1 data block pointer. Points to the data for channel 1 (string 2).

SPECTRUM +2 ROM 0 DISASSEMBLY

IY+\$04 / IY+\$05	Channel 2 data block pointer. Points to the data for channel 2 (string 3).
IY+\$06 / IY+\$07	Channel 3 data block pointer. Points to the data for channel 3 (string 4).
IY+\$08 / IY+\$09	Channel 4 data block pointer. Points to the data for channel 4 (string 5).
IY+\$0A / IY+\$0B	Channel 5 data block pointer. Points to the data for channel 5 (string 6).
IY+\$0C / IY+\$0D	Channel 6 data block pointer. Points to the data for channel 6 (string 7).
IY+\$0E / IY+\$0F	Channel 7 data block pointer. Points to the data for channel 7 (string 8).
IY+\$10	Channel bitmap. Initialised to \$FF and a 0 rotated in to the left for each string parameters of the PLAY command, thereby indicating the channels in use.
IY+\$11 / IY+\$12	Channel data block duration pointer. Points to duration length store in channel 0 data block (string 1).
IY+\$13 / IY+\$14	Channel data block duration pointer. Points to duration length store in channel 1 data block (string 2).
IY+\$15 / IY+\$16	Channel data block duration pointer. Points to duration length store in channel 2 data block (string 3).
IY+\$17 / IY+\$18	Channel data block duration pointer. Points to duration length store in channel 3 data block (string 4).
IY+\$19 / IY+\$1A	Channel data block duration pointer. Points to duration length store in channel 4 data block (string 5).
IY+\$1B / IY+\$1C	Channel data block duration pointer. Points to duration length store in channel 5 data block (string 6).
IY+\$1D / IY+\$1E	Channel data block duration pointer. Points to duration length store in channel 6 data block (string 7).
IY+\$1F / IY+\$20	Channel data block duration pointer. Points to duration length store in channel 7 data block (string 8).
IY+\$21	Channel selector. It is used as a shift register with bit 0 initially set and then shift to the left until a carry occurs, thereby indicating all 8 possible channels have been processed.
IY+\$22	Temporary channel bitmap, used to hold a working copy of the channel bitmap at IY+\$10.
IY+\$23 / IY+\$24	Address of the channel data block pointers, or address of the channel data block duration pointers (allows the routine at \$0A8D (ROM 0) to be used with both set of pointers).
IY+\$25 / IY+\$26	Stores the smallest duration length of all currently playing channel notes.
IY+\$27 / IY+\$28	The current tempo timing value (derived from the tempo parameter 60..240 beats per second).
IY+\$29	The current effect waveform value.
IY+\$2A	Temporary string counter selector.
IY+\$2B..IY+\$37	Holds a floating point calculator routine.
IY+\$38..IY+\$3B	Not used.

Channel Data Block Format

IX+\$00	The note number being played on this channel (equivalent to index offset into the note table).
---------	--

SPECTRUM +2 ROM o DISASSEMBLY

IX+\$01	MIDI channel assigned to this string (range 0 to 15).
IX+\$02	Channel number (range 0 to 7), i.e. index position of the string within the PLAY command.
IX+\$03	12*Octave number (0, 12, 24, 36, 48, 60, 72, 84 or 96).
IX+\$04	Current volume (range 0 to 15, or if bit 4 set then using envelope).
IX+\$05	Last note duration value as specified in the string (range 1 to 9).
IX+\$06 / IX+\$07	Address of current position in the string.
IX+\$08 / IX+\$09	Address of byte after the end of the string.
IX+\$0A	Flags: Bit 0 : 1=Single closing bracket found (repeat string indefinitely). Bits 1-7: Not used (always 0).
IX+\$0B	Open bracket nesting level (range \$00 to \$04).
IX+\$0C / IX+\$0D	Return address for opening bracket nesting level 0 (points to character after the bracket).
IX+\$0E / IX+\$0F	Return address for opening bracket nesting level 1 (points to character after the bracket).
IX+\$10 / IX+\$11	Return address for opening bracket nesting level 2 (points to character after the bracket).
IX+\$12 / IX+\$13	Return address for opening bracket nesting level 3 (points to character after the bracket).
IX+\$14 / IX+\$15	Return address for opening bracket nesting level 4 (points to character after the bracket).
IX+\$16	Closing bracket nesting level (range \$FF to \$04).
IX+\$17...IX+\$18	Return address for closing bracket nesting level 0 (points to character after the bracket).
IX+\$19...IX+\$1A	Return address for closing bracket nesting level 1 (points to character after the bracket).
IX+\$1B...IX+\$1C	Return address for closing bracket nesting level 2 (points to character after the bracket).
IX+\$1D...IX+\$1E	Return address for closing bracket nesting level 3 (points to character after the bracket).
IX+\$1F...IX+\$20	Return address for closing bracket nesting level 4 (points to character after the bracket).
IX+\$21	Tied notes counter (for a single note the value is 1).
IX+\$22 / IX+\$23	Duration length, specified in 96ths of a note.
IX+\$24...IX+\$25	Subsequent note duration length (used only with triplets), specified in 96ths of a note.
IX+\$26...IX+\$36	Not used.

L09A4: DI Disable interrupts to ensure accurate timing.

Create a workspace for the play channel command strings

PUSH BC	B=Number of channel string (range 1 to 8). Also used as string index number in the following loop.

IX points to start of space for the last channel. Default octave is 5. No MIDI channel assigned. Default volume is 15. Default note duration. Count of the number of tied notes. Signal not to repeat the string indefinitely. No opening bracket nesting level. No closing bracket nesting level. Return address for closing bracket nesting level 0. [No need to initialise this since it is written to before it is ever tested]
--------	---	---

[BUG - At this point interrupts are disabled and IY is now being used as a pointer to the master PLAY information block. Unfortunately, interrupts are enabled during the STK_FETCH call and IY is left containing the wrong value. This means that if an interrupt were to occur during execution of the subroutine then there would be a one in 65536 chance that (IY+\$40) will be corrupted - this corresponds to the volume setting for music channel A. Rewriting the SWAP routine to only re-enable interrupts if they were originally enabled would cure this bug (see end of file for description of her suggested fix). Credit: Toni Baker, ZX Computing Monthly] [An alternative and simpler solution to the

SPECTRUM +2 ROM o DISASSEMBLY

fix Toni Baker describes would be to stack IY, set IY to point to the system variables at \$5C3A, call STK_FETCH, disable interrupts, then pop the stacked value back to IY. Credit: Paul Farrow]

RST 28H	Get the details of the string from the stack.
DEFW STK_FETCH	\$2BF1.
DI	Interrupts get re-enabled by the call mechanism to ROM 1 so disable them again.
LD (IX+\$06),E	Store the current position within in the string, i.e. the beginning of it.
LD (IX+\$07),D	
LD (IX+\$0C),E	Store the return position within the string for a closing bracket,
LD (IX+\$0D),D	which is initially the start of the string in case a single closing bracket is found.
EX DE,HL	HL=Points to start of string. BC=Length of string.
ADD HL,BC	HL=Points to address of byte after the string.
LD (IX+\$08),L	Store the address of the character just after the string.

--------	--	--

Calculate Timing Loop Counter « RAM Routine »

This routine is copied into the command data block (offset \$2B..\$37) by the routine at \$0A24 (ROM 0). It uses the floating point calculator found in ROM 1, which is usually invoked via a RST \$28 instruction. Since ROM 0 uses RST \$28 to call a routine in ROM 1, it is unable to invoke the floating point calculator this way. It therefore copies the following routine to RAM and calls it with ROM 1 paged in. The routine calculates $(10/x)/7.33e-6$, where x is the tempo 'T' parameter value multiplied by 4. The result is used as an inner loop counter in the wait routine at \$0F95 (ROM 0).

Each iteration of this loop takes 26 T-states. The time taken by 26 T-states is 7.33e-6 seconds. So the total time for the loop to execute is 2.5/TEMPO seconds.

Entry: The value $4 \times \text{TEMPO}$ exists on the calculator stack (where TEMPO is in the range 60..240).

Exit: The calculator stack holds the result.

L0A50:	RST 28H DEFB \$A4 DEFB \$01 DEFB \$05 DEFB \$34 DEFB \$DF DEFB \$75 DEFB \$F4	Invoke the floating point calculator. stk-ten. = x, 10 exchange. = 10, x division. = 10/x stk-data. = 10/x, 7.33e-6 - exponent \$6F (floating point number 7.33e-6). - mantissa byte 1 - mantissa byte 2

PLAY Command (Continuation)

This section is responsible for processing the PLAY command and is a continuation of the routine at \$09A4 (ROM 0). It begins by determining the first note to play on each channel and then enters a loop to play these notes, fetching the subsequent notes to play at the appropriate times.

L0A9C:	CALL L0A6E	Select channel data block pointers.
L0A9F:	RR (IY+\$22)	Working copy of channel bitmap. Test if next string present.
	JR C,L0AAB	Jump ahead if there is no string for this channel.

HL=Address of channel data pointer.

CALL L0A86	Get address of channel data block for the current string into IX.
------------	---

SPECTRUM +2 ROM o DISASSEMBLY

	CALL L0B7B	Find the first note to play for this channel from its play string.
L0AAB:	SLA (IY+\$21)	Have all channels been processed?
	JR C,L0AB6	Jump ahead if so.
	CALL L0A8D	Advance to the next channel data block pointer.
	JR L0A9F	Jump back to process the next channel.

The first notes to play for each channel have now been determined. A loop is entered that coordinates playing the notes and fetching subsequent notes when required. Notes across channels may be of different lengths and so the shortest one is determined, the tones for all channels set and then a waiting delay entered for the shortest note delay. This delay length is then subtracted from all channel note lengths to leave the remaining lengths that each note needs to be played for. For the channel with the smallest note length, this will now have completely played and so a new note is fetched for it. The smallest length of the current notes is then determined again and the process described above repeated. A test is made on each iteration to see if all channels have run out of data to play, and if so this ends the PLAY command.

L0AB6:	CALL L0FB0	Find smallest duration length of the current notes across all channels.
	PUSH DE	Save the smallest duration length.
	CALL L0F61	Play a note on each channel.
	POP DE	DE=The smallest duration length.
L0ABE:	LD A,(IY+\$10)	Channel bitmap.
	CP \$FF	Is there anything to play?
	JR NZ,L0ACA	Jump if there is.
	CALL L0EB2	Turn off all sound and restore IY.
	EI	Re-enable interrupts.
	RET	End of play command.

	POP HL	
	RET	

Multiply DE by 10

L0B6F:	LD HL,\$0000	
	LD B,\$0A	Add DE to HL ten times.
L0B74:	ADD HL,DE	
	JR C,L0B61	Jump ahead if an overflow to produce error report "I number too big".
	DJNZ L0B74	
	EX DE,HL	Transfer the result into DE.
	RET	

Find Next Note from Channel String

L0B7B:	CALL L0A5D	Test for BREAK being pressed.
	JR C,L0B88	Jump ahead if not pressed.

SPECTRUM +2 ROM o DISASSEMBLY

	CALL L0EB2	Turn off all sound and restore IY.
	EI	Re-enable interrupts.
	CALL L05CB	Produce error report. [Could have saved 1 byte by using JP \$05F5 (ROM 0)]
	DEFB \$14	"L Break into program"
L0B88:	CALL L0AE4	Get the current character from the PLAY string, and advance the position pointer.
	JP C,L0DC1	Jump if at the end of the string.
	CALL L0E0F	Find the handler routine for the PLAY command character.
	LD B,\$00	
	SLA C	Generate the offset into the
	LD HL,L0DE9	command vector table.
	ADD HL,BC	HL points to handler routine for this command character.
	LD E,(HL)	
	INC HL	
	LD D,(HL)	Fetch the handler routine address.
	EX DE,HL	HL=Handler routine address for this command character.
	CALL L0BA3	Make an indirect call to the handler routine.
	JR L0B7B	Jump back to handle the next character in the string.

Comes here after processing a non-numeric digit that does not have a specific command routine handler Hence the next note to play has been determined and so a return is made to process the other channels.

L0BA2:	RET	Just make a return.
L0BA3:	JP (HL)	Jump to the command handler routine.

Play Command '!' (Comment)

A comment is enclosed within exclamation marks, e.g. "!" A comment !".

Entry: IX=Address of the channel data block.

L0BA4:	CALL L0AE4	Get the current character from the PLAY string, and advance the position pointer.
	JP C,L0DC0	Jump if at the end of the string.
	CP '!'	\$21. Is it the end-of-comment character?
	RET Z	Return if it is.
	JR L0BA4	Jump back to test the next character.

Play Command 'O' (Octave)

The 'O' command is followed by a numeric value within the range 0 to 8, although due to loose range checking the value MOD 256 only needs to be within 0 to 8. Hence O256 operates the same as O0.

Entry: IX=Address of the channel data block.

L0BAF:	CALL L0B3C	Get following numeric value from the string into BC.
	LD A,C	Is it between 0 and 8?
	CP \$09	
	JP NC,L0F31	Jump if above 8 to produce error report "n Out of range".
	SLA A	Multiply A by 12.
	SLA A	
	LD B,A	
	SLA A	
	ADD A,B	
	LD (IX+\$03),A	Store the octave value.
	RET	

Play Command 'N' (Separator)

The 'N' command is simply a separator marker and so is ignored.

Entry: IX=Address of the channel data block.

L0BC4:	RET	Nothing to do so make an immediate return.
--------	-----	--

Play Command '(' (Start of Repeat)

A phrase can be enclosed within brackets causing it to be repeated, i.e. played twice.

Entry: IX=Address of the channel data block.

L0BC5:	LD A,(IX+\$0B)	A=Current level of open bracket nesting.
	INC A	Increment the count.
	CP \$05	Only 4 levels supported.
	JP Z,L0F49	Jump if this is the fifth to produce error report "d Too many brackets".
	LD (IX+\$0B),A	Store the new open bracket nesting level.
	LD DE,\$000C	Offset to the bracket level return position stores.
	CALL L0C46	HL=Address of the pointer in which to store the return location of the bracket.

SPECTRUM +2 ROM 0 DISASSEMBLY

LD A,(IX+\$06)	Store the current string position as the return address of the open bracket.
LD (HL),A	
INC HL	
LD A,(IX+\$07)	
LD (HL),A	
RET	

Play Command ')' (End of Repeat)

A phrase can be enclosed within brackets causing it to be repeated, i.e. played twice.

Brackets can also be nested within each other, to 4 levels deep.

If a closing bracket is used without a matching opening bracket then the whole string up until that point is repeated indefinitely.

Entry: IX=Address of the channel data block.

LOBE1:	LD A,(IX+\$16)	Fetch the nesting level of closing brackets.
	LD DE,\$0017	Offset to the closing bracket return address store.
	OR A	Is there any bracket nesting so far?
	JP M,L0C0F	Jump if none. [Could have been faster by jumping to \$0C12 (ROM 0)]

Has the bracket level been repeated, i.e. re-reached the same position in the string as the closing bracket return address?

CALL L0C46	HL=Address of the pointer to the corresponding closing bracket return address store.
LD A,(IX+\$06)	Fetch the low byte of the current address.
CP (HL)	Re-reached the closing bracket?
JR NZ,L0C0F	Jump ahead if not.
INC HL	Point to the high byte.
LD A,(IX+\$07)	Fetch the high byte address of the current address.
CP (HL)	Re-reached the closing bracket?
JR NZ,L0C0F	Jump ahead if not.

The bracket level has been repeated. Now check whether this was the outer bracket level.

DEC (IX+\$16)	Decrement the closing bracket nesting level since this level has been repeated.
LD A,(IX+\$16)	[There is no need for the LD A,(IX+\$16) and OR A instructions since the DEC (IX+\$16) already set the flags]
OR A	Reached the outer bracket nesting level?

SPECTRUM +2 ROM o DISASSEMBLY

RET P	Return if not the outer bracket nesting level such that the character after the closing bracket is processed next.
-------	--

The outer bracket level has been repeated

BIT 0,(IX+\$0A)	Was this a single closing bracket?
RET Z	Return if it was not.

The repeat was caused by a single closing bracket so re-initialise the repeat

LD (IX+\$16),\$00	Restore one level of closing bracket nesting.
XOR A	Select closing bracket nesting level 0.
JR L0C2A	Jump ahead to continue.

A new level of closing bracket nesting

L0C0F:	LD A,(IX+\$16)	Fetch the nesting level of closing brackets.
	INC A	Increment the count.
	CP \$05	Only 5 levels supported (4 to match up with opening brackets and a 5th to repeat indefinitely).
	JP Z,L0F49	Jump if this is the fifth to produce error report "d Too many brackets".
	LD (IX+\$16),A	Store the new closing bracket nesting level.
	CALL L0C46	HL=Address of the pointer to the appropriate closing bracket return address store.
	LD A,(IX+\$06)	Store the current string position as the return address for the closing bracket.
	LD (HL),A	
	INC HL	
	LD A,(IX+\$07)	
	LD (HL),A	
	LD A,(IX+\$0B)	Fetch the nesting level of opening brackets.
L0C2A:	LD DE,\$000C	
	CALL L0C46	HL=Address of the pointer to the opening bracket nesting level return address store.
	LD A,(HL)	Set the return address of the nesting level's opening bracket
	LD (IX+\$06),A	as new current position within the string.
	INC HL	
	LD A,(HL)	For a single closing bracket only, this will be the start address of the string.
	LD (IX+\$07),A	
	DEC (IX+\$0B)	Decrement level of open bracket nesting.
	RET P	Return if the closing bracket matched an open bracket.

SPECTRUM +2 ROM o DISASSEMBLY

There is one more closing bracket then opening brackets, i.e. repeat string indefinitely

LD (IX+\$0B),\$00	Set the opening brackets nesting level to 0.
SET 0,(IX+\$0A)	Signal a single closing bracket only, i.e. to repeat the string indefinitely.
RET	

Get Address of Bracket Pointer Store

LOC46:	PUSH IX	
	POP HL	HL=IX.

	CP \$3C	
	JP C,L0F31	Jump if 59 or below to produce error report "n Out of range".
	CP \$F1	
	JP NC,L0F31	Jump if 241 or above to produce error report "n Out of range".

A holds a value in the range 60 to 240

LD A,(IX+\$02)	Fetch the channel number.
----------------	---------------------------

SPECTRUM +2 ROM 0 DISASSEMBLY

OR A	Tempo 'T' commands have to be specified in the first string.
RET NZ	If it is in a later string then ignore it.
LD B,\$00	[Redundant instruction - B is already zero]
PUSH BC	C=Tempo value.
POP HL	
ADD HL,HL	
ADD HL,HL	HL=Tempo*4.
PUSH HL	
POP BC	BC=Tempo*4. [Would have been quicker to use the combination LD B,H and LD C,L]
PUSH IY	Save the pointer to the play command data block.
RST 28H	
DEFW STACK_BC	\$2D2B. Place the contents of BC onto the stack. The call restores IY to \$5C3A.
DI	Interrupts get re-enabled by the call mechanism to ROM 1 so disable them again.
POP IY	Restore IY to point at the play command data block.
PUSH IY	Save the pointer to the play command data block.
PUSH IY	
POP HL	HL=pointer to the play command data block.
LD BC,\$002B	
ADD HL,BC	HL =IY+\$002B.
LD IY,\$5C3A	Reset IY to \$5C3A since this is required by the floating point calculator.
PUSH HL	HL=Points to the calculator RAM routine.
LD HL,L0C95	
LD (RETADDR),HL	\$5B5A. Set up the return address.
LD HL,YOUNGER	
EX (SP),HL	Stack the address of the swap routine used when returning to this ROM.
PUSH HL	Re-stack the address of the calculator RAM routine.
JP SWAP	\$5B00. Toggle to other ROM and make a return to the calculator RAM routine.

Tempo Command Return

The calculator stack now holds the value $(10/(\text{Tempo} \times 4))/7.33\text{e-}6$ and this is stored as the tempo value. The result is used as an inner loop counter in the wait routine at \$0F95 (ROM 0). Each iteration of this loop takes 26 T-states. The time taken by 26 T-states is $7.33\text{e-}6$ seconds. So the total time for the loop to execute is $2.5/\text{TEMPO}$ seconds.

LOC95:	DI	Interrupts get re-enabled by the call mechanism to ROM 1 so disable them again.
--------	----	---

SPECTRUM +2 ROM 0 DISASSEMBLY

RST 28H	
DEFW FP_TO_BC	\$2DA2. Fetch the value on the top of the calculator stack.
DI	Interrupts get re-enabled by the call mechanism to ROM 1 so disable them again.
POP IY	Restore IY to point at the play command data block.
LD (IY+\$27),C	Store tempo timing value.
LD (IY+\$28),B	
RET	

Play Command 'M' (Mixer)

This command is used to select whether to use tone and/or noise on each of the 3 channels. It is followed by a numeric value in the range 1 to 63, although due to loose range checking the value MOD 256 only needs to be within 0 to 63. Hence M256 operates the same as M0.
Entry: IX=Address of the channel data block.

LOCA3:	CALL L0B3C	Get following numeric value from the string into BC.
	LD A,C	A=Mixer value.
	CP \$40	Is it 64 or above?
	JP NC,L0F31	Jump if so to produce error report "n Out of range".

Bit 0: 1=Enable channel A tone.
Bit 1: 1=Enable channel B tone.
Bit 2: 1=Enable channel C tone.
Bit 3: 1=Enable channel A noise.
Bit 4: 1=Enable channel B noise.
Bit 5: 1=Enable channel C noise.

CPL	Invert the bits since the sound generator's mixer register uses active low enable. This also sets bit 6 1, which selects the I/O port as an output.
LD E,A	E=Mixer value.
LD D,\$07	D=Register 7 - Mixer.
CALL L0E9B	Write to sound generator register to set the mixer.
RET	[Could have saved 1 byte by using JP \$0E9B (ROM 0)]

Play Command 'V' (Volume)

This sets the volume of a channel and is followed by a numeric value in the range 0 (minimum) to 15 (maximum), although due to loose range checking the value MOD 256 only needs to be within 0 to 15. Hence V256 operates the same as V0.

Entry: IX=Address of the channel data block.

LOCB4:	CALL L0B3C	Get following numeric value from the string into BC.
	LD A,C	
	CP \$10	Is it 16 or above?
	JP NC,L0F31	Jump if so to produce error report "n Out of range".
	LD (IX+\$04),A	Store the volume level.

[BUG - An attempt to set the volume for a sound chip channel is now made. However, this routine fails to take into account that it is also called to set the volume for a MIDI only channel, i.e. play strings 4 to 8. As a result, corruption occurs to various sound generator registers, causing spurious sound output. There is in fact no need for this routine to set the volume for any channels since this is done every time a new note is played - see routine at \$0AB6 (ROM 0). the bug fix is to simply to make a return at this point. This routine therefore contains 11 surplus bytes. Credit: Ian Collier (+3), Paul Farrow (128)]

LD E,(IX+\$02)	E=Channel number.
LD A,\$08	Offset by 8.
ADD A,E	A=8+index.
LD D,A	D=Sound generator register number for the channel.
LD E,C	E=Volume level.
CALL L0E9B	Write to sound generator register to set the volume for the channel.
RET	[Could have saved 1 byte by using JP \$0E9B (ROM 0)]

Play Command 'U' (Use Volume Effect)

This command turns on envelope waveform effects for a particular sound chip channel. The volume level is now controlled by the selected envelope waveform for the channel, as defined by the 'W' command. MIDI channels do not support envelope waveforms and so the routine has the effect of setting the volume of a MIDI channel to maximum, i.e. 15. It might seem odd that the volume for MIDI channels is set to 15 rather than just filtered out. However, the three sound chip channels can also drive three MIDI channels and so it would be inconsistent for these MIDI channels to have their volume set to 15 but have the other MIDI channels behave differently. However, it could be argued that all MIDI channels should be unaffected by the 'U' command.

There are no parameters to this command.

SPECTRUM +2 ROM o DISASSEMBLY

Entry: IX=Address of the channel data block.

LOCCC:	LD E,(IX+\$02)	Get the channel number.
	LD A,\$08	Offset by 8.
	ADD A,E	A=8+index.
	LD D,A	D=Sound generator register number for the channel. [This is not used and so there is no need to generate it. It was probably a left over from copying and modifying the 'V' command routine. Deleting it would save 7 bytes. Credit: Ian Collier (+3), Paul Farrow (128)]
	LD E,\$1F	E=Select envelope defined by register 13, and reset volume bits to maximum (though these are not used with the envelope).
	LD (IX+\$04),E	Store that the envelope is being used (along with the reset volume level).
	RET	

Play command 'W' (Volume Effect Specifier)

This command selects the envelope waveform to use and is followed by a numeric value in the range 0 to 7, although due to loose range checking the value MOD 256 only needs to be within 0 to 7. Hence W256 operates the same as W0.

Entry: IX=Address of the channel data block.

LOCD9:	CALL L0B3C	Get following numeric value from the string into BC.
	LD A,C	
	CP \$08	Is it 8 or above?
	JP NC,L0F31	Jump if so to produce error report "n Out of range".

	LD HL,L0E07	Envelope waveform lookup table.
	ADD HL,BC	HL points to the corresponding value in the table.
	LD A,(HL)	
	LD (IY+\$29),A	Store new effect waveform value.
	RET	

Play Command 'X' (Volume Effect Duration)

This command allows the duration of a waveform effect to be specified, and is followed by a numeric value in the range 0 to 65535. A value of 1 corresponds to the minimum duration, increasing up to 65535 and then maximum duration for a value of 0. If no numeric value is specified then the maximum duration is used.

SPECTRUM +2 ROM o DISASSEMBLY

Entry: IX=Address of the channel data block.

LOCED:	CALL L0B3C	Get following numeric value from the string into BC.
	LD D,\$0B	Register 11 - Envelope Period Fine.
	LD E,C	
	CALL L0E9B	Write to sound generator register to set the envelope period (low byte).
	INC D	Register 12 - Envelope Period Coarse.
	LD E,B	
	CALL L0E9B	Write to sound generator register to set the envelope period (high byte).
	RET	[Could have saved 1 byte by using JP \$0E9B (ROM 0)]

Play Command 'Y' (MIDI Channel)

This command sets the MIDI channel number that the string is assigned to and is followed by a numeric value in the range 1 to 16, although due to loose range checking the value MOD 256 only needs to be within 1 to 16.

Hence Y257 operates the same as Y1.

Entry: IX=Address of the channel data block.

LOCFC:	CALL L0B3C	Get following numeric value from the string into BC.
	LD A,C	
	DEC A	Is it 0?
	JP M,L0F31	Jump if so to produce error report "n Out of range".
	CP \$10	Is it 10 or above?
	JP NC,L0F31	Jump if so to produce error report "n Out of range".
	LD (IX+\$01),A	Store MIDI channel number that this string is assigned to.
	RET	

Play Command 'Z' (MIDI Programming Code)

This command is used to send a programming code to the MIDI port. It is followed by a numeric value in the range 0 to 255, although due to loose range checking the value MOD 256 only needs to be within 0 to 255. Hence Z256 operates the same as Z0.

Entry: IX=Address of the channel data block.

SPECTRUM +2 ROM o DISASSEMBLY

L0D0D:	CALL L0B3C	Get following numeric value from the string into BC.
	LD A,C	A=(low byte of) the value.
	CALL L11C2	Write byte to MIDI device.
	RET	[Could have saved 1 byte by using JP \$0E9B (ROM 0)]

Play Command 'H' (Stop)

This command stops further processing of a play command. It has no parameters.

Entry: IX=Address of the channel data block.

L0D15:	LD (Y+\$10),\$FF	Indicate no channels to play, thereby causing
	RET	the play command to terminate.

Play Commands 'a'..'g', 'A'..'G', '1'.."12", '&' and '_'

This handler routine processes commands 'a'..'g', 'A'..'G', '1'.."12", '&' and '_', and determines the length of the next note to play. It provides the handling of triplet and tied notes.

It stores the note duration in the channel data block's duration length entry, and sets a pointer in the command data block's duration lengths pointer table to point at it. A single note letter is deemed to be a tied note count of 1. Triplets are deemed a tied note count of at least 2.

Entry: IX=Address of the channel data block.

A=Current character from play string.

L0D1A:	CALL L0E38	Is the current character a number?
	JP C,L0DA0	Jump if not number digit.

Envelope Waveform Lookup Table

Table used by the play "W" command to find the corresponding envelope value to write to the sound generator envelope shape register (register 13). This filters out the two duplicate waveforms possible from the sound generator and allows the order of the waveforms to be arranged in a more logical fashion.

L0E07:	DEFB \$00	W0 - Single decay then off. (Continue off, attack off, alternate off, hold off)
	DEFB \$04	W1 - Single attack then off. (Continue off, attack on, alternate off, hold off)
	DEFB \$0B	W2 - Single decay then hold. (Continue on, attack off, alternate on, hold on)
	DEFB \$0D	W3 - Single attack then hold. (Continue on, attack on, alternate off, hold on)
	DEFB \$08	W4 - Repeated decay. (Continue on, attack off, alternate off, hold off)
	DEFB \$0C	W5 - Repeated attack. (Continue on, attack on, alternate off, hold off)
	DEFB \$0E	W6 - Repeated attack-decay. (Continue on, attack on, alternate on, hold off)
	DEFB \$0A	W7 - Repeated decay-attack. (Continue on, attack off, alternate on, hold off)

Identify Command Character

This routine attempts to match the command character to those in a table.

The index position of the match indicates which command handler routine is required to process the character. Note that commands are case sensitive.

Entry: A=Command character.

Exit: Zero flag set if a match was found.

BC=Identifying the character matched, 1 to 15 for match and 0 for no match.

L0E0F:	LD BC,\$000F	Number of characters + 1 in command table.
	LD HL,L0AD6	Start of command table.
	CPIR	Search for a match.
	RET	

Semitones Table

This table contains an entry for each note of the scale, A to G, and is the number of semitones above the note C.

L0E18:	DEFB \$09	'A'
	DEFB \$0B	'B'
	DEFB \$00	'C'
	DEFB \$02	'D'
	DEFB \$04	'E'
	DEFB \$05	'F'
	DEFB \$07	'G'

Find Note Duration Length

	LD B,\$00	
	LD HL,L0E2B	Note duration table.
	ADD HL,BC	Index into the table.
	LD D,\$00	
	LD E,(HL)	Fetch the length from the table.
	POP HL	Restore HL.
	RET	

Note Duration Table

A whole note is given by a value of 96d and other notes defined in relation to this.

SPECTRUM +2 ROM o DISASSEMBLY

The value of 96d is the lowest common denominator from which all note durations can be defined.

L0E2B:	DEFB \$80	Rest [Not used since table is always indexed into with a value of 1 or more]
	DEFB \$06	Semi-quaver (sixteenth note).
	DEFB \$09	Dotted semi-quaver (3/32th note).
	DEFB \$0C	Quaver (eighth note).
	DEFB \$12	Dotted quaver (3/16th note).
	DEFB \$18	Crotchet (quarter note).
	DEFB \$24	Dotted crotchet (3/8th note).
	DEFB \$30	Minim (half note).
	DEFB \$48	Dotted minim (3/4th note).
	DEFB \$60	Semi-breve (whole note).
	DEFB \$04	Triplet semi-quaver (1/24th note).
	DEFB \$08	Triplet quaver (1/12th note).
	DEFB \$10	Triplet crotchet (1/6th note).

Is Numeric Digit?

Tests whether a character is a number digit.

Entry: A=Character.

Exit : Carry flag reset if a number digit.

L0E38:	CP '0'	\$30. Is it '0' or less?
	RET C	Return with carry flag set if so.
	CP ':'	\$3A. Is it more than '9'?
	CCF	
	RET	Return with carry flag set if so.

Play a Note On a Sound Chip Channel

This routine plays the note at the current octave and current volume on a sound chip channel. For play strings 4 to 8, it simply stores the note number and this is subsequently played later.

Entry: IX=Address of the channel data block.

A=Note value as number of semitones above C (0..11).

L0E3F:	LD C,A	C=The note value.
	LD A,(IX+\$03)	Octave number * 12.
	ADD A,C	Add the octave number and the note value to form the note number.
	CP \$80	Is note within range?
	JP NC,L0F51	Jump if not to produce error report "m Note out of range".

SPECTRUM +2 ROM o DISASSEMBLY

CALL L0E9B	Play a note and set the volume on the assigned MIDI channel.
L0F88: CALL L118D	Have all channels been processed?
L0F8B: SLA (IY+\$21)	Return if so.
RET C	Advance to the next channel data block pointer.
CALL L0A8D	Jump back to process the next channel.
JR L0F64	

Wait Note Duration

This routine is the main timing control of the PLAY command.

It waits for the specified length of time, which will be the lowest note duration of all active channels.

The actual duration of the wait is dictated by the current tempo.

Entry: DE=Note duration, where 96d represents a whole note.

Enter a loop waiting for $(135 + ((26 * (\text{tempo} - 100)) - 5)) * \text{DE} + 5$ T-states

L0F95: PUSH HL	(11) Save HL.
LD L,(IY+\$27)	(19) Get the tempo timing value.
LD H,(IY+\$28)	(19)
LD BC,\$0064	(10) BC=100
OR A	(4)
SBC HL,BC	(15) HL=tempo timing value - 100.
PUSH HL	(11)
POP BC	(10) BC=tempo timing value - 100.
POP HL	(10) Restore HL.

Tempo timing value = $(10 / (\text{TEMPO} * 4)) / 7.33\text{e-}6$, where 7.33e-6 is the time for 26 T-states.

SPECTRUM +2 ROM o DISASSEMBLY

The loop below takes 26 T-states per iteration, where the number of iterations is given by the tempo timing value.

So the time for the loop to execute is $2.5/\text{TEMPO}$ seconds.

For a TEMPO of 60 beats (crotchets) per second, the time per crotchet is $1/24$ second.

The duration of a crotchet is defined as 24 from the table at \$0E0C, therefore the loop will get executed 24 times and hence the total time taken will be 1 second.

The tempo timing value above has 100 subtracted from it, presumably to approximately compensate for the overhead time previously taken to prepare the notes for playing. This reduces the total time by 2600 T-states, or 733us.

L0FA5:	DEC BC	(6) Wait for tempo-100 loops.
	LD A,B	(4)
	OR C	(4)
	JR NZ,L0FA5	(12/7)
	DEC DE	(6) Repeat DE times
	LD A,D	(4)
	OR E	(4)
	JR NZ,L0F95	(12/7)
	RET	(10)

Find Smallest Duration Length

This routine finds the smallest duration length for all current notes being played across all channels.

Exit: DE=Smallest duration length.

L0FB0:	LD DE,\$FFFF	Set smallest duration length to 'maximum'.
	CALL L0A69	Select channel data block duration pointers.
L0FB6:	RR (IY+\$22)	Working copy of channel bitmap. Test if next string present.
	JR C,L0FCE	Jump ahead if there is no string for this channel.

POP HL	HL=Channel duration length.
POP BC	Last channel duration length.
OR A	

SPECTRUM +2 ROM 0 DISASSEMBLY

SBC HL,BC	Is current channel's duration length smaller than the smallest so far?
JR C,L0FCE	Jump ahead if so, with the new smallest value in DE.

The current channel's duration was not smaller so restore the last smallest into DE.

	PUSH BC	
	POP DE	DE=Smallest duration length.
L0FCE:	SLA (IY+\$21)	Have all channel strings been processed?
	JR C,L0FD9	Jump ahead if so.
	CALL L0A8D	Advance to the next channel data block duration pointer.
	JR L0FB6	Jump back to process the next channel.
L0FD9:	LD (IY+\$25),E	
	LD (IY+\$26),D	Store the smallest channel duration length.
	RET	

Play a Note on Each Channel and Update Channel Durations Lengths

This routine is used to play a note and set the volume on all channels.

It subtracts an amount of time from the duration lengths of all currently playing channel note durations. The amount subtracted is equivalent to the smallest note duration length currently being played, and as determined earlier.

Hence one channel's duration will go to 0 on each call of this routine, and the others will show the remaining lengths of their corresponding notes.

Entry: IY=Address of the command data block.

L0FE0:	XOR A	
	LD (IY+\$2A),A	Holds a temporary channel bitmap.
	CALL L0A6E	Select channel data block pointers.

INC HL	Update the duration length for this channel with the remaining length.
LD (HL),D	
JR L1079	Jump ahead to update the next channel.

The current channel uses the smallest found duration length

[A note has been completed and so the channel volume is set to 0 prior to the next note being played. This occurs on both sound chip channels and MIDI channels. When a MIDI channel is assigned to more than one play string and a rest is used in one of those strings. As soon as the end of the rest period is encountered, the channel's volume is set to off even though one of the other play strings controlling the MIDI channel may still be playing. This can be seen using the command PLAY "Y1a&", "Y1N9a". Here, string 1 starts playing 'a' for the period of a crotchet (1/4 of a note), where as string 2 starts playing 'a' for nine periods of a crotchet (9/4 of a note). When string 1 completes its crotchet, it requests to play a period of silence via the rest '&'. This turns the volume of the MIDI channel off even though string 2 is still timing its way through its nine crotchets. The play command will therefore continue for a further seven crotchets but in silence. This is because the volume for note is set only at its start and no coordination occurs between strings to turn the volume back on for the second string. It is arguably what the correct behaviour should be in such a circumstance where the strings are providing conflicting instructions, but having the latest command or note take precedence seems a logical approach. Credit: Ian Collier (+3), Paul Farrow (128)]

Check whether another channel needs its duration length updated

L1079:	SLA (IY+\$21)	Have all channel strings been processed?
	JR C,L1085	Jump ahead if so.
	CALL L0A8D	Advance to the next channel data pointer.
	JP L0FE7	Jump back to update the duration length for the next channel.

[BUG - By this point, the volume for both sound chip and MIDI channels has been set to 0, i.e. off. So although the new notes have been set playing on the sound chip channels, no sound is audible. For MIDI channels, no new notes have yet been output and hence these are also silent. If the time from turning the volume off for the current note to the time to turn the volume on for the next note is short enough, then it will not be noticeable. However, the code at \$1085 (ROM 0) introduces a 1/96th of a note delay and as a result a 1/96th of a note period of silence between notes. The bug can be resolved by simply deleting the two instructions below that introduce the delay. A positive side effect of the bug in the 'V' volume command at \$0CB4 (ROM 0) is that it can be used to overcome the gaps of silence between notes for sound chip channels. By interspersing volume commands between notes, a new volume level is immediately set before the 1/96th of a note delay is introduced for the new note. Therefore, the delay occurs when the new note is audible instead of when it is silent. For example, PLAY "cv15cv15c" instead of PLAY "ccc". The note durations are still 1/96th of a note longer than they should be though. This technique will only work on the sound chip channels and not for any MIDI channels. Credit: Ian Collier (+3), Paul Farrow (128)]

L1085:	LD DE,\$0001	Delay for 1/96th of a note.
	CALL L0F95	
	CALL L0A6E	Select channel data block pointers.

SPECTRUM +2 ROM o DISASSEMBLY

L108E:	RR (IY+\$2A)	Temporary channel bitmap. Test if next string present.
	JR NC,L10AB	Jump ahead if there is no string for this channel.
	CALL L0A86	Get address of channel data block for the current string into IX.
	LD A,(IX+\$02)	Get the channel number.
	CP \$03	Is it channel 0, 1 or 2, i.e. a sound chip channel?
	JR NC,L10A8	Jump ahead if so to process the next channel.
	LD D,\$08	
	ADD A,D	
	LD D,A	D=Register (8+channel number) - Channel volume.
	LD E,(IX+\$04)	Get the current volume.
	CALL L0E9B	Write to sound generator register to set the volume of the channel.
L10A8:	CALL L118D	Play a note and set the volume on the assigned MIDI channel.
L10AB:	SLA (IY+\$21)	Have all channels been processed?
	RET C	Return if so.
	CALL L0A8D	Advance to the next channel data pointer.
	JR L108E	Jump back to process the next channel.

Note Lookup Table

Each word gives the value of the sound generator tone registers for a given note.

There are 9 octaves, containing a total of 108 notes. These represent notes 21 to 128. Notes 0 to 20 cannot be reproduced on the sound chip and so note 21 will be used for all of these (they will however be sent to a MIDI device if one is assigned to a channel). [Note that both the sound chip and the MIDI port can not play note 128 and so its inclusion in the table is a waste of 2 bytes]. The PLAY command does not allow octaves higher than 8 to be selected directly. Using PLAY "O8G" will select note 115. To select higher notes, sharps must be included, e.g. PLAY "O8#G" for note 116, PLAY "O8##G" for note 117, etc, up to PLAY "O8#####G" for note 127. Attempting to access note 128 using PLAY "O8#####G" will lead to error report "m Note out of range".

Play Note on MIDI Channel

This routine turns on a note on the MIDI channel and sets its volume, if MIDI channel is assigned to the current string.

Three bytes are sent, and have the following meaning:

Byte 1: Channel number \$00..\$0F, with bits 4 and 7 set.

Byte 2: Note number \$00..\$7F.

Byte 3: Note velocity \$00..\$78.

Entry: IX=Address of the channel data block.

L118D:	LD A,(IX+\$01)	Is a MIDI channel assigned to this string?
	OR A	
	RET M	Return if not.

A holds the assigned channel number (\$00..\$0F)

OR \$90	Set bits 4 and 7 of the channel number. A=\$90..\$9F.
CALL L11C2	Write byte to MIDI device.
LD A,(IX+\$00)	The note number.

SPECTRUM +2 ROM o DISASSEMBLY

CALL L11C2	Write byte to MIDI device.
LD A,(IX+\$04)	Fetch the channel's volume.
RES 4,A	Ensure the 'using envelope' bit is reset so
SLA A	that A holds a value between \$00 and \$0F.
SLA A	Multiply by 8 to increase the range to \$00..\$78.
SLA A	A=Note velocity.
CALL L11C2	Write byte to MIDI device.
RET	[Could have saved 1 byte by using JP \$11C2
	(ROM 0)]

Turn MIDI Channel Off

This routine turns off a note on the MIDI channel, if a MIDI channel is assigned to the current string. Three bytes are sent, and have the following meaning:

Byte 1: Channel number \$00..\$0F, with bit 7 set.

Byte 2: Note number \$00..\$7F.

Byte 3: Note velocity \$40.

Entry: IX=Address of the channel data block.

L11AC:	LD A,(IX+\$01)	Is a MIDI channel assigned to this string?
	OR A	
	RET M	Return if not.

A holds the assigned channel number (\$00..\$0F)

OR \$80	Set bit 7 of the channel number. A=\$80..\$8F.
CALL L11C2	Write byte to MIDI device.
LD A,(IX+\$00)	The note number.
CALL L11C2	Write byte to MIDI device.
LD A,\$40	The note velocity.
CALL L11C2	Write byte to MIDI device.
RET	[Could have saved 1 byte by using JP \$11C2
	(ROM 0)]

Send Byte to MIDI Device

This routine sends a byte to the MIDI port. MIDI devices communicate at 31250 baud, although this routine actually generates a baud rate of 31388, which is within the 1% tolerance supported by MIDI devices.

Entry: A=Byte to send.

L11C2:	LD L,A	Store the byte to send.
	LD BC,\$FFFD	

SPECTRUM +2 ROM 0 DISASSEMBLY

	AND A	Is it SAVE?
	JR NZ,L154A	Jump ahead if not.
	RST 28H	
	DEFW SA_CONTROL	\$0970. Run the save routine in ROM 1.
	RET	

In the case of a LOAD, VERIFY or MERGE command the first seventeen bytes of the 'header area' in the work space hold the prepared information, as detailed above and it is now time to fetch a 'header' from the tape.

L154A:	RST 28H	
	DEFW SA_ALL+\$0007	\$0761. Run the load/merge/verify routine in ROM 1.
	RET	

EDITOR ROUTINES — PART 1

Relist the BASIC Program from the Current Line

This routine lists the BASIC program from the current line number. It initially shows the last line displayed but rows may subsequently be scrolled up until the required BASIC line has been found. The structure of the ROM program only supports listing BASIC lines that are 20 rows or less; larger lines are shown truncated to 20 rows.

L154E:	LD HL,\$EEF5	Flags.
	RES 0,(HL)	Signal this is not the current line.

SPECTRUM +2 ROM o DISASSEMBLY

SET 1,(HL)

Signal not yet located the current line.

A loop is entered to display a screenful of program listing. If the current line number is not found in the lines displayed then all lines are scrolled up and the listing reproduced. This procedure repeats until the current line number has been found and displayed.

L1555:	LD HL,(\$5C49)	E_PPC. Fetch current line number.
	LD A,H	
	OR L	Is there a currently selected line?
	JR NZ,L155F	Jump ahead if so.
	LD (\$EC06),HL	Set to \$0000 to indicate no editable characters before the cursor.
L155F:	LD A,(\$F9DB)	Fetch the number of rows of the BASIC line that are in the Above-Screen Line Edit Buffer, i.e. that are off the top of the screen.
	PUSH AF	Line number of the BASIC line at the top of the screen (or 0 for the first line).
	LD HL,(\$FC9A)	Find closest line number (or \$0000 if no subsequent line exists).
	CALL L3370	Store the line number of the BASIC line being edited in the buffer.
	LD (\$F9D7),HL	Set default Above-Screen Line Edit Buffer settings.
	CALL L3248	Set default Below-Screen Line Edit Buffer settings.
	CALL L30FC	A=Number of rows of the BASIC line that are in the Above-Screen Line Edit Buffer.
	POP AF	Are there any rows off the top of the screen?
L1573:	OR A	Jump ahead if not.
	JR Z,L1582	

The current settings indicate that the top BASIC line straggles into the Above-Screen Line Edit Buffer. It is therefore necessary to insert the current BASIC line into the Below-Screen Line Edit Buffer and then shift the appropriate number of rows into the Above-Screen Line Edit Buffer.

	PUSH AF	Save the number of rows off the top of the screen.
	CALL L3105	Copy a BASIC line from the program area into the Below-Screen Line Edit Buffer.
	EX DE,HL	DE=Address of the Below-Screen Line Edit Buffer.
	CALL L3290	Shift up a row into the Above-Screen Line Edit Buffer.
	POP AF	Retrieve the number of rows off the top of the screen.
	DEC A	Decrement the number of rows.
	JR L1573	Jump back to shift up another row if required.

SPECTRUM +2 ROM o DISASSEMBLY

Either there the top BASI Cline does not straggle off the top of the the screen or the appropriate number of rows have been copied into the Above-Screen Line Edit Buffer. In the latter case, the Below-Screen Line Edit Buffer contains the remaining rows of the BASIC line and which be copied into the top of the Screen Line Edit Buffer.

L1582:	LD C,\$00 CALL L30DA LD B,C LD A,(\$EC15) LD C,A PUSH BC PUSH DE	C=Row 0. DE=Start address in Screen Line Edit Buffer of the first row, as specified in C. B=Row 0. The number of editing rows on screen. C=Number of editing rows on screen. B=Row number, C=Number of editing rows on screen. DE=Start address in Screen Line Edit Buffer of the first row.
--------	--	--

Enter a loop to copy BASIC line rows into the Screen Line Edit Buffer. The Below-Screen Line Edit Buffer is used as a temporary store for holding each BASIC line as it is copied into the Screen Line Edit Buffer. If the top BASIC line straggles above the screen then this loop is entered with the remains of the line already in the Below-Screen Line Edit Buffer.

L158E:	CALL L3105 LD A,(\$EEF5) BIT 1,A JR Z,L15B5	Shift up all rows of the BASIC line in the Below-Screen Line Edit Buffer, or if empty then copy a BASIC line from the program area into it. If no BASIC line available then empty the first row of the Below-Screen Line Edit Buffer. Listing flags. Has the current line been previously found? Jump if so.
--------	--	---

The current line has not yet been found so examine the current row in case it is the current line

PUSH DE	DE=Start address in Screen Line Edit Buffer of the current row.
PUSH HL	HL=Address of the first row in the Below-Screen Line Edit Buffer.
LD DE,\$0020	Point to the flag byte for the first row.
ADD HL,DE	Is it the first row of a BASIC line?
BIT 0,(HL)	Jump if not.
JR Z,L15B3	

The Below-Screen Line Edit Buffer contains a complete BASIC line so determine whether this is the current line

INC HL	
LD D,(HL)	Get line number into DE.

	PUSH HL	HL=Address of the current row in the Below-Screen Line Edit Buffer.
	LD BC,\$0023	
	LDIR	Copy the first row of the BASIC line in the Below-Screen Line Edit Buffer into the next row of the Screen Line Edit Buffer.
	POP HL	HL=Address of the current row in the Below-Screen Line Edit Buffer.
	POP BC	B=Row number, C=Number of editing rows on screen.
	PUSH DE	DE=Start address in Screen Line Edit Buffer of the next row.
	PUSH BC	B=Row number, C=Number of editing rows on screen.
	EX DE,HL	DE=Address of the current row in the Below-Screen Line Edit Buffer.
	LD HL,\$EEF5	Flags.
	BIT 0,(HL)	Is this the current line?
	JR Z,L15F2	Jump if not.

This is the current line so scan across the BASIC line to locate the cursor column position

L15CA:	LD B,\$00	Column 0.
	LD HL,(\$EC06)	HL=Count of the number of editable characters in the BASIC line up to the cursor within the Screen Line Edit Buffer.
	LD A,H	
	OR L	Are there any editable characters in this row prior to the cursor?

SPECTRUM +2 ROM 0 DISASSEMBLY

JR Z,L15DF

Jump if there are none, i.e. cursor at start of the row.

There are editable characters on this row prior to the cursor [**BUG** - Entering ' 10 REM' or '0010 REM' will insert the line into the program area but instead of placing the cursor on the following row it is placed after the following BASIC line, or if the line inserted was the last in the program then the cursor is placed on row 20. The bug occurs due to the leading spaces or zeros, and hence will apply to every BASIC command. When the line is inserted into the Screen Line Edit Buffer, the leading spaces are discarded and hence the line length is shorter than that typed in. However, it is the typed in line length that is used when parsing the BASIC line in the Screen Line Edit Buffer and as a result this causes an attempt to find the remaining characters on the following row of the Screen Line Edit Buffer. If another BASIC line is on the following Screen Line Edit Buffer row then the search completes and the cursor is placed on the row after this BASIC line. If there is not a BASIC line on the following row then the search continues on the next row. Since this will also be empty, the search advances onto the next row, and then the next, and so on until row 20 is reached. To fix the bug, the typed in character count until the cursor (held in \$EC06) ideally needs to be adjusted to match the actual number of characters stored in the Screen Line Edit Buffer. However, this is not a trivial change to implement. A simpler solution to fix the bug is to intercept when a move to the next row is made and to determine whether the BASIC line actually continues on this row. Credit: Paul Farrow] [To fix the bug, the POP HL and JR NC,\$15EA (ROM 0) instructions following the call to \$2E67 (ROM 0) should be replaced with the following. Credit: Paul Farrow.

	DEFW L1C2B	New ERASE routine in ROM 0.
L17C5:	DEFB \$0E	CLASS-0E CAT
	DEFW L1C04	New CAT routine in ROM 0.
L17C8:	DEFB \$0C	CLASS-0C SPECTRUM
	DEFW L1B4A	SPECTRUM routine in ROM 0.
L17CB:	DEFB \$0E	CLASS-0E PLAY
	DEFW L2336	PLAY routine in ROM 0.

(From Logan & O'Hara's 48K ROM disassembly):

The requirements for the different command classes are as follows: CLASS-00 - No further operands.

CLASS-01 - Used in LET. A variable is required.

CLASS-02 - Used in LET. An expression, numeric or string, must follow.

CLASS-03 - A numeric expression may follow. Zero to be used in case of default.

CLASS-04 - A single character variable must follow.

CLASS-05 - A set of items may be given.

CLASS-06 - A numeric expression must follow.

CLASS-07 - Handles colour items.

CLASS-08 - Two numeric expressions, separated by a comma, must follow.

CLASS-09 - As for CLASS-08 but colour items may precede the expressions.

CLASS-0A - A string expression must follow.

SPECTRUM +2 ROM 0 DISASSEMBLY

CLASS-0B - Handles cassette/RAM disk routines.

In addition the 128 adds the following classes:

CLASS-0C - Like class 00 but calling ROM 0. (Used by SPECTRUM, MOVE, COPY, NEW, GO SUB, RETURN)

CLASS-0D - Like class 06 but calling ROM 0. (Used by CLEAR, RUN)

CLASS-0E - Handled in ROM 0. (Used by PLAY, ERASE, CAT, FORMAT, CIRCLE, LPRINT, LLIST, DRAW, DATA, READ, LIST, DIM, INPUT, PRINT, FOR, IF)

The 'Main Parser' Of the BASIC Interpreter

The parsing routine of the BASIC interpreter is entered at \$17CE (ROM 0) when syntax is being checked, and at \$1857 (ROM 0) when a BASIC program of one or more statements is to be executed. This code is similar to that in ROM 1 at \$1B17.

L17CE:	RES 7,(IY+\$01)	FLAGS. Signal 'syntax checking'.
	RST 28H	
	DEFW E_LINE_NO	\$19FB. CH-ADD is made to point to the first code after any line number
	XOR A	
	LD (\$5C47),A	SUBPPC. Set to \$00.
	DEC A	
	LD (\$5C3A),A	ERR_NR. Set to \$FF.
	JR L17E0	Jump forward to consider the first statement of the line.

The Statement Loop

Each statement is considered in turn until the end of the line is reached.

L17DF:	RST 20H	Advance CH-ADD along the line.
L17E0:	RST 28H	
	DEFW SET_WORK	\$16BF. The work space is cleared.
	INC (IY+\$0D)	SUBPPC. Increase SUBPPC on each passage around the loop.
	JP M,L1931	Only '127' statements are allowed in a single line. Jump to report "C Nonsense in BASIC".
	RST 18H	Fetch a character.
	LD B,\$00	Clear the register for later.
	CP \$0D	Is the character a 'carriage return'?
	JP Z,L1882	jump if it is.
	CP ':'	\$3A. Go around the loop again if it is a ':'.
	JR Z,L17DF	

A statement has been identified so, first, its initial command is considered

SPECTRUM +2 ROM o DISASSEMBLY

	LD HL,L1840	Pre-load the machine stack with the return address.
	PUSH HL	
	LD C,A	Save the command temporarily
	RST 20H	in the C register whilst CH-ADD is advanced again.
	LD A,C	
	SUB \$CE	Reduce the command's code by \$CE giving the range indexed from \$00.
	JR NC,L1813	Jump for DEF FN and above.
	ADD A,\$CE	
	LD HL,L17C8	
	CP \$A3	Is it 'SPECTRUM'?
	JR Z,L181F	Jump if so into the scanning loop with this address.
	LD HL,L17CB	
	CP \$A4	Is it 'PLAY'?
	JR Z,L181F	Jump if so into the scanning loop with this address.
L1813:	JP L1931	Produce error report "C Nonsense in BASIC".
	LD C,A	Move the command code to BC (B holds \$00).
	LD HL,L16FB	The base address of the syntax offset table.
	ADD HL,BC	
	LD C,(HL)	
	ADD HL,BC	Find address for the command's entries in the parameter table.
	JR L181F	Jump forward into the scanning loop with this address.

Each of the command class routines applicable to the present command are executed in turn. Any required separators are also considered.

L181C:	LD HL,(\$5C74)	T_ADDR. The temporary pointer to the entries in the parameter table.
L181F:	LD A,(HL)	Fetch each entry in turn.
	INC HL	Update the pointer to the entries for the next pass.
	LD (\$5C74),HL	T_ADDR.
	LD BC,L181C	Pre-load the machine stack with the return address.
	PUSH BC	
	LD C,A	Copy the entry to the C register for later.
	CP \$20	
	JR NC,L1839	Jump forward if the entry is a 'separator'.
	LD HL,L18D4	The base address of the 'command class' table.
	LD B,\$00	
	ADD HL,BC	Index into the table.

SPECTRUM +2 ROM o DISASSEMBLY

LD C,(HL)	HL=base + code + (base + code).
ADD HL,BC	HL=The starting address of the required
PUSH HL	command class routine.
RST 18H	Before making an indirect jump to the command
DEC B	class routine pass the command code
RET	to the A register and set the B register to \$FF.
	Return to the stacked address.

The 'Separator' Subroutine

The report 'Nonsense in BASIC is given if the required separator is not present.

But note that when syntax is being checked the actual report does not appear on the screen - only the 'error marker'.

This code is similar to that in ROM 1 at \$1B6F.

L1839:	RST 18H	The current character is
	CP C	fetchd and compared to the entry in the
		parameter table.
	JP NZ,L1931	Give the error report if there is not a match.
	RST 20H	Step past a correct character
	RET	and return.

The 'Statement Return' Subroutine

After the correct interpretation of a statement, a return is made to this entry point.

This code is similar to that in ROM 1 at \$1B76.

L1840:	CALL L05F5	Check for BREAK
	JR C,L1849	Jump if pressed.
	CALL L05CB	Produce error report.
	DEFB \$14	"L Break into program"
L1849:	BIT 7,(IY+\$0A)	NSPPC - statement number in line to be jumped
		to
	JP NZ,L18C7	Jump forward if there is not a 'jump' to be made.
	LD HL,(\$5C42)	NEWPPC, line number to be jumped to.
	BIT 7,H	
	JR Z,L186B	Jump forward unless dealing with a further
		statement in the editing area.

The 'Line Run' Entry Point

This entry point is used wherever a line in the editing area is to be 'run'.

SPECTRUM +2 ROM 0 DISASSEMBLY

In such a case the syntax/run flag (bit 7 of FLAGS) will be set.

The entry point is also used in the syntax checking of a line in the editing area that has more than one statement (bit 7 of FLAGS will be reset).

This code is similar to that in ROM 1 at \$1B8A.

L1857:	LD HL,\$FFFE	A line in the editing area is considered as line '-2'.
	LD (\$5C45),HL	PPC.
	LD HL,(\$5C61)	WORKSP. Make HL point to the end marker of the editing area.
	DEC HL	
	LD DE,(\$5C59)	E_LINE. Make DE point to the location before the end marker of the editing area.
	DEC DE	
	LD A,(\$5C44)	NSPPC. Fetch the number of the next statement to be handled.
	JR L18A1	Jump forward.

The 'Line New' Subroutine

There has been a jump in the program and the starting address of the new line has to be found.

This code is similar to that in ROM 1 at 1B9E.

L186B:	RST 28H	\$196E. The starting address of the line, or the 'first line after' is found.
	DEFW LINE_ADDR	NSPPC. Collect the statement number.
	LD A,(\$5C44)	Jump forward if the required line was found.
	JR Z,L188F	Check the validity of the statement number - must be zero.
	AND A	Jump if not to produce error report "N Statement lost".
	JR NZ,L18BC	Also check that the 'first line after' is not after the actual 'end of program'.
	LD B,A	
	LD A,(HL)	
	AND \$C0	
	LD A,B	
	JR Z,L188F	Jump forward with valid addresses; otherwise signal the error 'OK'.
	CALL L05CB	Produce error report.
	DEFB \$FF	"0 OK"

REM Routine

The return address to STMT-RET is dropped which has the effect of forcing the rest of the line to be ignored.

SPECTRUM +2 ROM o DISASSEMBLY

This code is similar to that in ROM 1 at \$1BB2.

L1881:	POP BC	Drop the statement return address.
--------	--------	------------------------------------

The 'Line End' Routine

If checking syntax a simple return is made but when 'running' the address held by NXTLIN has to be checked before it can be used.

This code is similar to that in ROM 1 at \$1BB3.

L1882:	BIT 7,(IY+\$01)	
	RET Z	Return if syntax is being checked.
	LD HL,(\$5C55)	NXTLIN.
	LD A,\$C0	Return if the address is after the end of the program - the 'run' is finished.
	AND (HL)	
	RET NZ	
	XOR A	Signal 'statement zero' before proceeding.

The 'Line Use' Routine

This routine has three functions:

- i. Change statement zero to statement '1'.
- ii. Find the number of the new line and enter it into PPC.
- iii. Form the address of the start of the line after.

This code is similar to that in ROM 1 at \$1BBF.

L188F:	CP \$01	Statement zero becomes statement 1.
	ADC A,\$00	
	LD D,(HL)	The line number of the line to be used is collected and passed to PPC.
	INC HL	
	LD E,(HL)	
	LD (\$5C45),DE	PPC.
	INC HL	
	LD E,(HL)	Now find the 'length' of the line.
	INC HL	
	LD D,(HL)	
	EX DE,HL	Switch over the values.
	ADD HL,DE	Form the address of the start of the line after in HL and the location before the 'next' line's first character in DE.
	INC HL	

The 'Next Line' Routine

On entry the HL register pair points to the location after the end of the 'next' line to be handled and the DE register pair to the location before the first character of the line.

This applies to lines in the program area and also to a line in the editing area - where the next line will be the same line again whilst there are still statements to be interpreted.

This code is similar to that in ROM 1 at \$1BD1.

L18A1:	LD (\$5C55),HL	NXTLIN. Set NXTLIN for use once the current line has been completed.
	EX DE,HL	
	LD (\$5C5D),HL	CH_ADD. CH_ADD points to the location before the first character to be considered.
	LD D,A	The statement number is fetched.
	LD E,\$00	The E register is cleared in case the 'Each Statement' routine is used.
	LD (IY+\$0A),\$FF	NSPPC. Signal 'no jump'.
	DEC D	
	LD (IY+\$0D),D	SUB_PPC. Statement number-1.
	JP Z,L17DF	Jump if the first statement.
	INC D	For later statements the 'starting address' has to be found.
	RST 28H	
	DEFW EACH_STMT	\$198B.
	JR Z,L18C7	Jump forward unless the statement does not exist.
L18BC:	CALL L05CB	Produce error report.
	DEFB \$16	"N Statement lost"

The 'CHECK-END' Subroutine

This is called when the syntax of the edit-line is being checked. The purpose of the routine is to give an error report if the end of a statement has not been reached and to move on to the next statement if the syntax is correct.

The routine is the equivalent of routine CHECK_END in ROM 1 at \$1BEE.

L18C0:	BIT 7,(IY+\$01)	Very like CHECK-END at 1BEE in ROM 1
	RET NZ	Return unless checking syntax.
	POP BC	Drop scan loop and statement return addresses.
	POP BC	

The 'STMT-NEXT' Routine

If the present character is a 'carriage return' then the 'next statement' is on the 'next line', if ':' it is on the same line; but if any other character is found then there is an error in syntax.

The routine is the equivalent of routine STMT_NEXT in ROM 1 at \$1BF4.

L18C7:	RST 18H	Fetch the present character.
	CP \$0D	Consider the 'next line' if
	JR Z,L1882	it is a 'carriage return'.
	CP ':'	\$3A. Consider the 'next statement'
	JP Z,L17DF	if it is a ':'.
	JP L1931	Otherwise there has been a syntax error so
		produce "C Nonsense in BASIC".

The 'Command Class' Table

L18D4:	DEFB L18F8-\$	CLASS-00 -> L18D9 = \$24
	DEFB L1918-\$	CLASS-01 -> L18F9 = \$43
	DEFB L191C-\$	CLASS-02 -> L18FD = \$46
	DEFB L18F5-\$	CLASS-03 -> L18D6 = \$1E
	DEFB L1924-\$	CLASS-04 -> L1905 = \$4C
	DEFB L18F9-\$	CLASS-05 -> L18DA = \$20
	DEFB L192D-\$	CLASS-06 -> L190E = \$53
	DEFB L1939-\$	CLASS-07 -> L191A = \$5E
	DEFB L1929-\$	CLASS-08 -> L190A = \$4D
	DEFB L1963-\$	CLASS-09 -> L1944 = \$86
	DEFB L1935-\$	CLASS-0A -> L1916 = \$57
	DEFB L1967-\$	CLASS-0B -> L1948 = \$88
	DEFB L18E6-\$	CLASS-0C -> L18C7 = \$06
	DEFB L18E3-\$	CLASS-0D -> L18C4 = \$02
	DEFB L18E7-\$	CLASS-0E -> L18C8 = \$05

The 'Command Classes — 0C, 0D & 0E'

For commands of class-0D a numeric expression must follow.

L18E3:	RST 28H	Code 0D enters here.
	DEFW FETCH_NUM	\$1CDE.

The commands of class-0C must not have any operands. e.g. SPECTRUM.

L18E6:	CP A	Code 0C enters here. Set zero flag.
--------	------	-------------------------------------

SPECTRUM +2 ROM o DISASSEMBLY

The commands of class-0E may be followed by a set of items. e.g. PLAY.

L18E7:	POP BC CALL Z,L18C0	Code 0E enters here. Retrieve return address. If handling commands of classes 0C & 0D and syntax is being checked move on now to consider the next statement.
	EX DE,HL	Save the line pointer in DE.

After the command class entries and the separator entries in the parameter table have been considered the jump to the appropriate command routine is made.

The routine is similar to JUMP-C-R in ROM 1 at \$1C16.

LD HL,(\$5C74) LD C,(HL)	T_ADDR. Fetch the pointer to the entries in the parameter table
INC HL LD B,(HL)	and fetch the address of the required command routine.
EX DE,HL	Exchange the pointers back.
PUSH BC RET	Make an indirect jump to the command routine.

The 'Command Classes — 00, 03 & 05'

These routines are the equivalent of the routines in ROM 1 starting at \$1C0D.

The commands of class-03 may, or may not, be followed by a number. e.g. RUN & RUN 200.

L18F5:	RST 28H DEFW FETCH_NUM	Code 03 enters here. \$1CDE. A number is fetched but zero is used in cases of default.
--------	---------------------------	--

The commands of class-00 must not have any operands. e.g. COPY & CONTINUE.

L18F8:	CP A	Code 00 enters here. Set the zero flag.
--------	------	---

The commands of class-05 may be followed by a set of items. e.g. PRINT & PRINT "222".

L18F9:	POP BC CALL Z,L18C0	Code 05 enters here. Drop return address. If handling commands of classes 00 & 03 and syntax is being checked move on now to consider the next statement.
	EX DE,HL	Save the line pointer in DE.
	LD HL,(\$5C74)	T_ADDR. Fetch the pointer to the entries in the parameter table.
	LD C,(HL)	

SPECTRUM +2 ROM 0 DISASSEMBLY

INC HL	
LD B,(HL)	Fetch the address of the required command routine.
EX DE,HL	Exchange the pointers back.
PUSH HL	Save command routine address.
LD HL,L1917	The address to return to (the RET below).
LD (RETADDR),HL	\$5B5A. Store the return address.
LD HL,YOUNGER	\$5B14. Paging subroutine.
EX (SP),HL	Replace the return address with the address of the YOUNGER routine.
PUSH HL	Save the original top stack item.
LD H,B	
LD L,C	HL=Address of command routine.
EX (SP),HL	Put onto the stack so that an indirect jump will be made to it.
JP SWAP	\$5B00. Switch to other ROM and 'return' to the command routine.

Comes here after ROM 1 has been paged in, the command routine called, ROM 0 paged back in.

L1917:	RET	Simply make a return.
--------	-----	-----------------------

The 'Command Class — 01'

Command class 01 is concerned with the identification of the variable in a LET, READ or INPUT statement.

L1918:	RST 28H	Delegate handling to ROM 1.
	DEFW CLASS_01	\$1C1F.
	RET	

The 'Command Class — 02'

Command class 02 is concerned with the actual calculation of the value to be assigned in a LET statement.

L191C:	POP BC	Code 02 enters here. Delegate handling to ROM 1.
	RST 28H	
	DEFW VAL_FET_1	\$1C56. "... used by LET, READ and INPUT statements to first evaluate and then assign values to the previously designated variable" (Logan/O'Hara)
	CALL L18C0	Move on to the next statement if checking syntax

The command class 04 entry point is used by FOR & NEXT statements.

L1924:	RST 28H	Code 04 enters here. Delegate handling to ROM 1.
	DEFW CLASS_04	\$1C6C.
	RET	

Command class 08 allows for two numeric expressions, separated by a comma, to be evaluated.

L1928:	RST 20H	[Redundant byte]
L1929:	RST 28H	Delegate handling to ROM 1.
	DEFW EXPT_2NUM	\$1C7A.
	RET	

Command class 06 allows for a single numeric expression to be evaluated.

L192D:	RST 28H	Code 06 enters here. Delegate handling to ROM 1.
	DEFW EXPT_1NUM	\$1C82.
	RET	

Report C — Nonsense in BASIC

L1931:	CALL L05CB	Produce error report. [Could have saved 4 bytes by using the identical routine at \$1238 (ROM 0) instead]
	DEFB \$0B	"C Nonsense in BASIC"

Command class 0A allows for a single string expression to be evaluated.

SPECTRUM +2 ROM o DISASSEMBLY

L1935:	RST 28H	Code 0A enters here. Delegate handling to ROM 1.
	DEFW EXPT_EXP	\$1C8C.
	RET	

The 'Command Class — 07'

Command class 07 is the command routine for the six colour item commands.
Makes the current temporary colours permanent.

L1939:	BIT 7,(IY+\$01)	The syntax/run flag is read.
	RES 0,(IY+\$02)	TV_FLAG. Signal 'main screen'.
	JR Z,L1946	Jump ahead if syntax checking.
	RST 28H	Only during a 'run' call TEMPS to ensure the temporary
	DEFW TEMPS	\$0D4D. colours are the main screen colours.
L1946:	POP AF	Drop the return address.
	LD A,(\$5C74)	T_ADDR.
	SUB (L179E & \$00FF)+\$28	Reduce to range \$D9-\$DE which are the token codes for INK to OVER.
	RST 28H	
	DEFW CO_TEMP_4	\$21FC. Change the temporary colours as directed by the BASIC statement.
	CALL L18C0	Move on to the next statement if checking syntax.
	LD HL,(\$5C8F)	ATTR_T. Now the temporary colour
	LD (\$5C8D),HL	ATTR_P. values are made permanent
	LD HL,\$5C91	P_FLAG.
	LD A,(HL)	Value of P_FLAG also has to be considered.

The following instructions cleverly copy the even bits of the supplied byte to the odd bits.
In effect making the permanent bits the same as the temporary ones.

RLCA	Move the mask leftwards.
XOR (HL)	Impress onto the mask
AND \$AA	only the even bits of the
XOR (HL)	other byte.
LD (HL),A	Restore the result.
RET	

The 'Command Class — 09'

This routine is used by PLOT, DRAW & CIRCLE statements in order to specify the default conditions of 'FLASH 8; BRIGHT 8; PAPER 8;' that are set up before any embedded colour items are considered.

SPECTRUM +2 ROM o DISASSEMBLY

L1963:	RST 28H	Code 09 enters here. Delegate handling to ROM 1.
	DEFW CLASS_09	\$1CB E.
	RET	

The 'Command Class — 0B'

This routine is used by SAVE, LOAD, VERIFY & MERGE statements.

L1967:	POP AF	Drop the return address.
	LD A,(FLAGS3)	\$5B66.
	AND \$0F	Clear LOAD/SAVE/VERIFY/MERGE indication bits.
	LD (FLAGS3),A	\$5B66.
	LD A,(\$5C74)	T_ADDR-lo.
	SUB 1+(L1792 & \$00FF)	Correct by \$74 so that SAVE = \$00, LOAD = \$01, VERIFY = \$02, MERGE = \$03.
	LD (\$5C74),A	T_ADDR-lo.
	JP Z,L120A	Jump to handle SAVE.
	DEC A	
	JP Z,L1211	Jump to handle LOAD.
	DEC A	
	JP Z,L1218	Jump to handle VERIFY.
	JP L121F	Jump to handle MERGE.

IF Routine

On entry the value of the expression between the IF and the THEN is the 'last value' on the calculator stack. If this is logically true then the next statement is considered; otherwise the line is considered to have been finished.

L1986:	POP BC	Drop the return address.
	BIT 7,(IY+\$01)	
	JR Z,L199D	Jump forward if checking syntax.

Now 'delete' the last value on the calculator stack

L198D:	LD HL,(\$5C65)	STKEND.
	LD DE,\$FFFB	-5
	ADD HL,DE	The present 'last value' is deleted.
	LD (\$5C65),HL	STKEND. HL point to the first byte of the value.
	RST 28H	
	DEFW TEST_ZERO	\$34E9. Is the value zero?
	JP C,L1882	If the value was 'FALSE' jump to the next line.

SPECTRUM +2 ROM o DISASSEMBLY

L199D:	JP L17E0	But if 'TRUE' jump to the next statement (after the THEN).
--------	----------	--

FOR Routine

This command routine is entered with the VALUE and the LIMIT of the FOR statement already on the top of the calculator stack.

L19A0:	CP \$CD	Jump forward unless a 'STEP' is given.
	JR NZ,L19AD	
	RST 20H	Advance pointer
	CALL L192D	Indirectly call EXPT_1NUM in ROM 1 to get the value of the STEP.
	CALL L18C0	Move on to the next statement if checking syntax.
	JR L19C5	Otherwise jump forward.

There has not been a STEP supplied so the value '1' is to be used.

L19AD:	CALL L18C0	Move on to the next statement if checking syntax.
	LD HL,(\$5C65)	STKEND.
	LD (HL),\$00	
	INC HL	
	LD (HL),\$00	
	INC HL	
	LD (HL),\$01	
	INC HL	
	LD (HL),\$00	
	INC HL	
	LD (HL),\$00	Place a value of 1 on the calculator stack.
	INC HL	
	LD (\$5C65),HL	STKEND.

The three values on the calculator stack are the VALUE (v), the LIMIT (l) and the STEP (s). These values now have to be manipulated. Delegate handling to ROM 1.

L19C5:	RST 28H	
	DEFW F_REORDER	\$1D16.
	RET	

READ Routine

L19C9:	RST 20H	Come here on each pass, after the first, to move along the READ statement.
--------	---------	--

SPECTRUM +2 ROM 0 DISASSEMBLY

L19CA:	CALL L1918	Indirectly call CLASS_01 in ROM 1 to consider whether the variable has been used before, and find the existing entry if it has.
	BIT 7,(IY+\$01)	
	JR Z,L1A01	Jump forward if checking syntax.
	RST 18H	Save the current pointer CH_ADD in X_PTR.
	LD (\$5C5F),HL	X_PTR.
	LD HL,(\$5C57)	DATADD.
	LD A,(HL)	Fetch the current DATA list pointer
	CP \$2C	and jump forward unless a new
	JR Z,L19EA	DATA statement has to be found.
	LD E,\$E4	The search is for 'DATA'.
	RST 28H	
	DEFW LOOK_PROG	\$1D86.
	JR NC,L19EA	Jump forward if the search is successful.
	CALL L05CB	Produce error report.
	DEFB \$0D	"E Out of Data"
Pick up a value from the DATA list.		
L19EA:	INC HL	Advance the pointer along the DATA list.
	LD (\$5C5D),HL	CH_ADD.
	LD A,(HL)	
	RST 28H	
	DEFW VAL_FET_1	\$1C56. Fetch the value and assign it to the variable.
	RST 18H	
	LD (\$5C57),HL	DATADD.
	LD HL,(\$5C5F)	X_PTR. Fetch the current value of CH_ADD and store it in DATADD.
	LD (IY+\$26),\$00	X_PTR_hi. Clear the address of the character after the '?' marker.
	LD (\$5C5D),HL	CH_ADD. Make CH-ADD once again point to the READ statement.
	LD A,(HL)	
L1A01:	RST 18H	GET the present character
	CP ','	\$2C. Check if it is a ','.
L1A04:	JR Z,L19C9	If it is then jump back as there are further items.
	CALL L18C0	Return if checking syntax
	RET	or here if not checking syntax.

DATA Routine

During syntax checking a DATA statement is checked to ensure that it contains a series of valid expressions, separated by commas. But in 'run-time' the statement is passed by.

SPECTRUM +2 ROM o DISASSEMBLY

L1A0A:	BIT 7,(IY+\$01)	Jump forward unless checking syntax.
	JR NZ,L1A1B	

A loop is now entered to deal with each expression in the DATA statement.

L1A10:	RST 28H	
	DEFW SCANNING	\$24FB. Scan the next expression.
	CP ','	\$2C. Check for the correct separator ','.
	CALL NZ,L18C0	but move on to the next statement if not matched.
	RST 20H	Whilst there are still expressions to be checked
	JR L1A10	go around again.

The DATA statement has to be passed-by in 'run-time'.

L1A1B:	LD A,\$E4	It is a 'DATA' statement that is to be passed-by.
--------	-----------	---

On entry the A register will hold either the token 'DATA' or the token 'DEF FN' depending on the type of statement that is being 'passed-by'.

L1A1D:	RST 28H	
	DEFW PASS_BY	\$1E39. Delegate handling to ROM 1.
	RET	

RUN Routine

The parameter of the RUN command is passed to NEWPPC by calling the GO TO command routine. The operations of 'RESTORE 0' and 'CLEAR 0' are then performed before a return is made.

L1A21:	RST 28H	
	DEFW GO_TO	\$1E67.
	LD BC,\$0000	Now perform a 'RESTORE 0'.
	RST 28H	
	DEFW REST_RUN	\$1E45.
	JR L1A2F	Exit via the CLEAR command routine.

CLEAR Routine

This routine allows for the variables area to be cleared, the display area cleared and RAMTOP moved. In consequence of the last operation the machine stack is rebuilt thereby having the effect of also clearing the GO SUB stack.

L1A2C:	RST 28H	
	DEFW FIND_INT2	\$1E99. Fetch the operand - using zero by default.

SPECTRUM +2 ROM o DISASSEMBLY

L1A2F:	LD A,B OR C JR NZ,L1A37	Jump forward if the operand is other than zero. When called from RUN there is no jump.
L1A37:	LD BC,(\$5CB2) PUSH BC LD DE,(\$5C4B) LD HL,(\$5C59) DEC HL RST 28H DEFW RECLAIM RST 28H DEFW CLS	RAMTOP. Use RAMTOP if the parameter is 0. BC = Address to clear to. Save it. VARS. E LINE. Delete the variables area. \$19E5. Clear the screen \$0D6B.

The value in the BC register pair which will be used as RAMTOP is tested to ensure it is neither too low nor too high.

	LD HL,(\$5C65) LD DE,\$0032 ADD HL,DE POP DE SBC HL,DE JR NC,L1A5A LD HL,(\$5CB4) AND A SBC HL,DE JR NC,L1A5E	STKEND. The current value of STKEND is increased by 50 before being tested. This forms the ADE = address to clear to lower limit.
L1A5A:	CALL L05CB DEFB \$15	Ramtop no good. P_RAMT. For the upper test the value for RAMTOP is tested against P_RAMT.
L1A5E:	LD (\$5CB2),DE POP DE POP HL POP BC	Jump forward if acceptable. Produce error report. "M Ramtop no good" RAMTOP. Retrieve interpreter return address from stack Retrieve 'error address' from stack Retrieve the GO SUB stack end marker. [BUG - It is assumed that the top of the GO SUB stack will be empty and hence only contain the end marker. This will not be the case if CLEAR is used within a subroutine, in which case BC will now hold the calling line number and this will be stacked in place of the end marker. When a RETURN command is encountered, the GO SUB stack appears to contain an entry since the end marker was not the top item. An attempt to return is therefore made. The CLEAR command handler within the 48K Spectrum ROM does not make any assumption about the contents of the GO SUB stack and instead always re-inserts the end marker. The bug could be fixed by inserting the

SPECTRUM +2 ROM o DISASSEMBLY

```
LD SP,($5CB2)
INC SP
PUSH BC
PUSH HL
LD ($5C3D),SP
PUSH DE
RET
```

line LD BC,\$3E00 after the POP BC. Credit: Ian Collier (+3), Paul Farrow (128)]
RAMTOP.

Stack the GO SUB stack end marker.
Stack 'error address'.
ERR_SP.
Stack the interpreter return address.

GO SUB Routine

The present value of PPC and the incremented value of SUBPPC are stored on the GO SUB stack.

L1A72:	POP DE LD H,(IY+\$0D) INC H EX (SP),HL INC SP LD BC,(\$5C45) PUSH BC PUSH HL LD (\$5C3D),SP PUSH DE RST 28H DEFW GO_TO LD BC,\$0014 RST 28H DEFW TEST_ROOM RET	Save the return address. SUBPPC. Fetch the statement number and increment it. Exchange the 'error address' with the statement number. Reclaim the use of a location. PPC. Next save the present line number. Return the 'error address' to the machine stack ERR-SP. and reset ERR-SP to point to it. Stack the return address. \$1E67. Now set NEWPPC & NSPPC to the required values. But before making the jump make a test for room. \$1F05. Will automatically produce error '4' if out of memory.
--------	---	--

RETURN Routine

The line number and the statement number that are to be made the object of a 'return' are fetched from the GO SUB stack.

L1A8E:	POP BC POP HL POP DE LD A,D	Fetch the return address. Fetch the 'error address'. Fetch the last entry on the GO SUB stack. The entry is tested to see if
--------	--------------------------------------	---

SPECTRUM +2 ROM o DISASSEMBLY

	CP \$3E	it is the GO SUB stack end marker.
	JR Z,L1AA5	Jump if it is.
	DEC SP	The full entry uses three locations only.
	EX (SP),HL	Exchange the statement number with the 'error address'.
	EX DE,HL	Move the statement number.
	LD (\$5C3D),SP	ERR_SP. Reset the error pointer.
	PUSH BC	Replace the return address.
	LD (\$5C42),HL	NEWPPC. Enter the line number.
	LD (IY+\$0A),D	NSPPC. Enter the statement number.
	RET	
L1AA5:	PUSH DE	Replace the end marker and
	PUSH HL	the 'error address'.
	CALL L05CB	Produce error report.
	DEFB \$06	"7 RETURN without GO SUB"

DEF FN Routine

During syntax checking a DEF FN statement is checked to ensure that it has the correct form. Space is also made available for the result of evaluating the function. But in 'run-time' a DEF FN statement is passed-by.

L1AAB:	BIT 7,(IY+\$01)	
	JR Z,L1AB6	Jump forward if checking syntax.
	LD A,\$CE	Otherwise pass-by the
	JP L1A1D	'DEF FN' statement.

First consider the variable of the function.

L1AB6:	SET 6,(IY+\$01)	Signal 'a numeric variable'.
	RST 28H	
	DEFW ALPHA	\$2C8D. Check that the present code is a letter.
	JR NC,L1AD5	Jump forward if not.
	RST 20H	Fetch the next character.
	CP '\$'	\$24.
	JR NZ,L1AC9	Jump forward unless it is a '\$'.
	RES 6,(IY+\$01)	Change bit 6 as it is a string variable.
	RST 20H	Fetch the next character.
L1AC9:	CP '('	\$28. A '(' must follow the variable's name.
	JR NZ,L1B09	Jump forward if not.
	RST 20H	Fetch the next character
	CP ')'	\$29. Jump forward if it is a ')' as there are no parameters of the function.
	JR Z,L1AF2	

A loop is now entered to deal with each parameter in turn.

SPECTRUM +2 ROM o DISASSEMBLY

L1AD2:	RST 28H	
	DEFW ALPHA	\$2C8D.
L1AD5:	JP NC,L1931	The present code must be a letter.
	EX DE,HL	Save the pointer in DE.
	RST 20H	Fetch the next character.
	CP '\$'	\$24.
	JR NZ,L1AE0	Jump forward unless it is a '\$'.
	EX DE,HL	Otherwise save the new pointer in DE instead.
	RST 20H	Fetch the next character.
L1AE0:	EX DE,HL	Move the pointer to the last character of the name to HL.
	LD BC,\$0006	Now make six locations after that last character.
	RST 28H	
	DEFW MAKE_ROOM	\$1655.
	INC HL	
	INC HL	
	LD (HL),\$0E	Enter a 'number marker' into the first of the new locations.
	CP ','	\$2C. If the present character is a ',' then jump back as
	JR NZ,L1AF2	there should be a further parameter.
	RST 20H	
	JR L1AD2	Otherwise jump out of the loop.

Next the definition of the function is considered.

L1AF2:	CP ')	\$29. Check that the ')' does exist.
	JR NZ,L1B09	Jump if not.
	RST 20H	The next character is fetched.
	CP '='	\$3D. It must be an '='.
	JR NZ,L1B09	Jump if not.
	RST 20H	Fetch the next character.
	LD A,(\$5C3B)	FLAGS.
	PUSH AF	Save the nature (numeric or string) of the variable
	RST 28H	
	DEFW SCANNING	\$24FB. Now consider the definition as an expression.
	POP AF	Fetch the nature of the variable.
	XOR (IY+\$01)	FLAGS. Check that it is of the same type
	AND \$40	as found for the definition.
L1B09:	JP NZ,L1931	Give an error report if required.
	CALL L18C0	Move on to consider the next statement in the line.

MOVE Routine

L1B0F: RET Simply return.

	LD HL,(\$5C59)	E_LINE.

SPECTRUM +2 ROM o DISASSEMBLY

LD (HL),\$E1
CALL L026B

Copy LLIST into the line editing area.
Parse and execute the BASIC line. [Will not return here but will exit via the error handler routine]

BASIC LINE AND COMMAND INTERPRETATION ROUTINES — PART 2

SPECTRUM Routine

Return to 48K BASIC Mode. This routine will force caps lock is off.

L1B4A:	CALL L1B72	Overwrite 'P' channel data to use the ZX Printer.
	LD SP,(\$5C3D)	ERR_SP. Purge the stack.
	POP HL	Remove error handler address.
	LD HL,MAIN_4	\$1303. The main execution loop within ROM 1.
	PUSH HL	
	LD HL,PRINT_A_1+\$0003	\$0013. Address of a \$FF byte within ROM 1, used to generate error report "0 OK".
	PUSH HL	
	LD HL,ERROR_1	\$0008. The address of the error handler within ROM 1.
	PUSH HL	

[BUG - Although the channel 'P' information has been reconfigured to use the ZX Printer, the ZX printer buffer and associated system variables still need to be cleared. Failure to do so means that the first use of the ZX Printer will cause garbage to be printed, i.e. the paging routines and new system variables still present in the ZX Printer buffer. Subsequently printer output will then be ok since the ZX Printer buffer and system variables will be cleared. Worse still, there is the possibility that new data to be printed will be inserted beyond the ZX Printer buffer since ROM 1 does not trap whether the ZX Printer system variable PR_POSN and PR_CC hold invalid values. The bug can be fixed by inserting the following instructions, which cause the ZX Printer buffer to be cleared immediately after switching to ROM 1 and before the error report "0 OK" is produced. Credit: Paul Farrow and Andrew Owen.]

LD HL,CLEAR_PRB	Address of the routine in ROM 1 to clear the ZX Printer buffer and associated system variables.
PUSH HL	
SET 1,(IY+\$01)	FLAGS. Signal the printer is in use.]

LD A,\$20	Force 48K mode.
LD (BANK_M),A	\$5B5C.
JP SWAP	\$5B00. Swap to ROM 1 and return via a RST \$08 / DEFB \$FF.

MENU ROUTINES — PART 2

Main Menu — 48 BASIC Option

L1B66:	LD HL,\$0000	Stack a \$0000 address to return to.
	PUSH HL	
	LD A,\$20	Force 48 mode.
	LD (BANK_M),A	\$5B5C
	JP SWAP	\$5B00. Swap to ROM 1, return to \$0000.

Set 'P' Channel Data

This routine overwrites the 'P' channel data with the 'S' channel data, i.e. the default values when using the ZX Printer.

L1B72:	LD HL,(\$5C4F)	CHANS.
	LD DE,\$0005	
	ADD HL,DE	HL=Address 'S' channel data.
	LD DE,\$000A	
	EX DE,HL	HL=\$000A, DE=Address 'S' channel data.
	ADD HL,DE	HL=Address 'P' channel data.
	EX DE,HL	DE=Address 'P' channel data, HL=Address 'S' channel data.
	LD BC,\$0004	
	LDIR	Copy the 'S' channel data over the 'P' channel data.
	RES 3,(IY+\$30)	FLAGS2. Signal caps lock unset. [Not really necessary for switching back to 48 BASIC mode]
	RES 4,(IY+\$01)	FLAGS. Signal not 128K mode.
	RET

--------	----------	---------------------------

NEW Routine

L21C9:	DI	
	JP L019D	Re-initialise the machine.

CIRCLE Routine

This routine draws an approximation to the circle with centre co-ordinates X and Y and radius Z. These numbers are rounded to the nearest integer before use.

Thus Z must be less than 87.5, even when (X,Y) is in the centre of the screen.

The method used is to draw a series of arcs approximated by straight lines.

L21CD:	RST 18H	Get character from BASIC line.
	CP ','	\$2C. Check for second parameter.
	JR NZ,L220A	Jump ahead (for error C) if not.
	RST 20H	Advance pointer into BASIC line.
	RST 28H	Get parameter.
	DEFW EXPT_1NUM	\$1C82. Radius to calculator stack.
	CALL L18C0	Move to consider next statement if checking syntax.
	RST 28H	
	DEFW CIRCLE+\$000D	\$232D. Delegate handling to ROM 1.
	RET	

DRAW Routine

This routine is entered with the co-ordinates of a point X0, Y0, say, in COORDS. If only two parameters X, Y are given with the DRAW command, it draws an approximation to a straight line from the point X0, Y0 to X0+X, Y0+Y.

SPECTRUM +2 ROM 0 DISASSEMBLY

If a third parameter G is given, it draws an approximation to a circular arc from X0, Y0 to X0+X, Y0+Y turning anti-clockwise through an angle G radians.

L21DD:	RST 18H	Get current character.
	CP ','	\$2C.
	JR Z,L21E9	Jump if there is a third parameter.
	CALL L18C0	Error C during syntax checking if not at end of line/statement.
	RST 28H	
	DEFW LINE_DRAW	\$2477. Delegate handling to ROM 1.
	RET

	RST 28H	
	DEFW EXPT_1NUM	\$1C82. Angle to calculator stack.
	CALL L18C0	Error C during syntax checking if not at end of line/statement.
	RST 28H	
	DEFW DR_3_PRMS+\$0007	\$2394. Delegate handling to ROM 1.
	RET	

DIM Routine

This routine establishes new arrays in the variables area. The routine starts by searching the existing variables area to determine whether there is an existing array with the same name. If such an array is found then it is 'reclaimed' before the new array is established. A new array will have all its elements set to zero if it is a numeric array, or to 'spaces' if it is an array of strings.

L21F4:	RST 28H	Search to see if the array already exists.
	DEFW LOOK_VARS	\$28B2.
	JR NZ,L220A	Jump if array variable not found.
	RST 28H	
	DEFW SYNTAX_Z	\$2530.
	JR NZ,L2206	Jump ahead during syntax checking.
	RES 6,C	Test the syntax for string arrays as if they were numeric.
	RST 28H	
	DEFW STK_VAR	\$2996. Check the syntax of the parenthesised expression.
	CALL L18C0	Error when checking syntax unless at end of line/statement.

An 'existing array' is reclaimed.

L2206:	RST 28H	
	DEFW D_RUN	\$2C15. Delegate handling to ROM 1.

SPECTRUM +2 ROM o DISASSEMBLY

CALL L05CB
DEFB \$2B

Produce error report.

"p (c) 1986 Sinclair Research Ltd" **[BUG** - This should be "Parameter error". The Spanish 128 produces "p Bad parameter" but to save memory perhaps the UK 128 was intended to use the existing "Q Parameter error" and the change of the error code byte here was overlooked. In that case it would have had a value of \$19. Note that generation of this error when using the main screen editor will result in a crash. Credit: Andrew Owen]

L234F: CALL L18C0
 JP L09A4

Ensure end-of-statement or end-of-line.
Continue with PLAY code.

UNUSED ROUTINES — PART 1

There now follows 513 bytes of routines that are not used by the ROM, from \$2355 (ROM 0) to \$2555 (ROM 0).

They are remnants of the original Spanish 128's ROM code, although surprisingly they appear in a different order within that ROM.

Return to Editor

[Never called by this ROM]

L2355: LD HL,TSTACK
 LD (OLDSP),HL
 CALL L1F64

 JP L25EA

\$5BFF.
\$5B81.
Use Workspace RAM configuration (physical
RAM bank 7).
Jump ahead to the Editor.

BC=HL-DE, Swap HL and DE

Exit: BC=HL-DE.

DE=HL, HL=DE.

[Never called by this ROM]

L2361: AND A
 SBC HL,DE
 LD B,H
 LD C,L
 ADD HL,DE
 EX DE,HL

BC=HL-DE.

HL=DE, DE=HL.

SPECTRUM +2 ROM 0 DISASSEMBLY

RET

Create Room for 1 Byte

Creates a single byte in the workspace, or automatically produces an error '4' if not.
[Never called by this ROM]

L2369:	LD BC,\$0001	Request 1 byte.
	PUSH HL	
	PUSH DE	
	CALL L2377	Test whether there is space. If it fails this will cause the error handler in ROM 0 to be called. If MAKE_ROOM were called directly and and out of memory condition detected then the ROM 1 error handler would be called instead.
	POP DE	
	POP HL	
	RST 28H	\$1655. The memory check passed so safely make the room.
	DEFW MAKE_ROOM	
	RET	

Room for BC Bytes?

Test whether there is room for the specified number of bytes in the spare memory, producing error "4 Out of memory" if not. This routine is very similar to that at \$3F66 with the exception that this routine assumes IY points at the system variables.

Entry: BC=Number of bytes required.

Exit : Returns if the room requested is available else an error '4' is produced.

[Called by the routine at \$2369 (ROM 0), which is itself never called by this ROM]

L2377:	LD HL,(\$5C65)	STKEND.
	ADD HL,BC	Would adding the specified number of bytes overflow the RAM area?
	JR C,L2387	Jump to produce an error if so.
	EX DE,HL	DE=New end address.
	LD HL,\$0082	Would there be at least 130 bytes at the top of RAM?
	ADD HL,DE	
	JR C,L2387	Jump to produce an error if not.
	SBC HL,SP	If the stack is lower in memory, would there still be enough room?
	RET C	Return if there would.
L2387:	LD (IY+\$00),\$03	Signal error "4 Out of Memory".
	JP L0321	Jump to error handler routine.

SPECTRUM +2 ROM o DISASSEMBLY

HL = A*32

[Called by routines at \$23A2 (ROM 0) and \$23D7 (ROM 0), which are themselves never called by this ROM]

L238E:	ADD A,A	A*2.
	ADD A,A	A*4. Then multiply by 8 in following routine.

HL = A*8

[Called by the routine at \$2400 (ROM 0), which ultimately is itself never called by this ROM]

L2390:	LD L,A	
	LD H,\$00	
	ADD HL,HL	A*2.
	ADD HL,HL	A*4.
	ADD HL,HL	A*8.
	RET	Return HL=A*8.

Find Amount of Free Space

Exit: Carry flag set if no more space, else HL holds the amount of free space.

[Never called by this ROM]

L2397:	LD HL,\$0000	
	ADD HL,SP	HL=SP.
	LD DE,(\$5C65)	STKEND.
	OR A	
	SBC HL,DE	Effectively SP-STKEND, i.e. the amount of available space.
	RET	

Print Screen Buffer Row

Prints row from the screen buffer to the screen.

Entry: A=Row number.

[Never called by this ROM]

L23A3:	RES 0,(IY-\$39)	KSTATE+1. Signal do not invert attribute value.
	CALL L238E	[IY+\$3B on the Spanish 128]
		HL=A*32. Number of bytes prior to the requested row.

SPECTRUM +2 ROM o DISASSEMBLY

PUSH HL	Save offset to requested row to print.
LD DE,(\$FF24)	Fetch address of screen buffer.
ADD HL,DE	Point to row entry.
LD D,H	
LD E,L	DE=Address of row entry.
EX (SP),HL	Stack address of row entry. HL=Offset to requested row to print.
PUSH HL	Save offset to requested row to print.
PUSH DE	Save address of row entry.
LD DE,\$5800	Attributes file.
ADD HL,DE	Point to start of corresponding row in attributes file.
EX DE,HL	DE=Start address of corresponding row in attributes file.
POP HL	HL=Address of row entry.
LD BC,\$0020	32 columns.
LD A,(\$5C8F)	ATTR_T. Fetch the temporary colours.
CALL L24BA	Set the colours for the 32 columns in this row, processing any colour control codes from the print string.
POP HL	HL=Offset to requested row to print.
LD A,H	
LD H,\$00	
ADD A,A	Calculate corresponding display file address.
ADD A,A	
ADD A,A	
ADD A,\$40	
LD D,A	
LD E,H	
ADD HL,DE	
EX DE,HL	DE=Display file address.
POP HL	HL=Offset to requested row to print.
LD B,\$20	32 columns.
JP L2400	Print one row to the display file.

Blank Screen Buffer Content

Sets the specified number of screen buffer positions from the specified row to \$FF.

Entry: A=Row number.

BC=Number of bytes to set.

[Never called by this ROM]

L23D7:	LD D,\$FF	The character to set the screen buffer contents to.
	CALL L238E	HL=A*32. Offset to the specified row.
	LD A,D	

SPECTRUM +2 ROM o DISASSEMBLY

LD DE,(\$FF24)	Fetch the address of the screen buffer.
ADD HL,DE	HL=Address of first column in the requested row.
LD E,L	
LD D,H	
INC DE	DE=Address of second column in the requested row.
LD (HL),A	Store the character.
DEC BC	
LDIR	Repeat for all remaining bytes required.
RET	

Print Screen Buffer to Display File

[Never called by this ROM]

L23EA:	CALL L24A7	Set attributes file from screen buffer.
	LD DE,\$4000	DE=First third of display file.
	LD HL,(\$FF24)	Fetch address of screen buffer.
	LD B,E	Display 256 characters.
	CALL L2400	Display string.
	LD D,\$48	Middle third of display file.
	CALL L2400	Display string.
	LD D,\$50	Last third of display file.
	LD B,\$C0	Display 192 characters.

Print Screen Buffer Characters to Display File

Displays ASCII characters, UDGs, graphic characters or two special symbols in the display file, but does not alter the attributes file. Character code \$FE is used to represent the error marker bug symbol and the character code \$FF is used to represent a null, which is displayed as a space.

Entry: DE=Display file address.

HL=Points to string to print.

B=Number of characters to print.

[Used by routine at \$23EA (ROM 0) and called by the routine at \$23A2 (ROM 0), both of which are themselves never called by this ROM]

L2400:	LD A,(HL)	Fetch the character.
	PUSH HL	Save string pointer.
	PUSH DE	Save display file address.
	CP \$FE	Was it \$FE (bug) or \$FF (null)?
	JR C,L240B	Jump ahead if not.
	SUB \$FE	Reduce range to \$00-\$01.
	JR L2441	Jump ahead to show symbol.

SPECTRUM +2 ROM 0 DISASSEMBLY

Comes here if character code if below \$FE

L240B:	CP \$20	Is it a control character?
	JR NC,L2416	Jump ahead if not.

Comes here if a control character

	LD HL,L2546	Graphic for a 'G' (not a normal G though). Used to indicate embedded colour control codes.
	AND A	Clear the carry flag to indicate no need to switch back to RAM bank 7.
	EX AF,AF'	Save the flag.
	JR L244A	Jump ahead to display the symbol.
L2416:	CP \$80	Is it a graphic character or UDG?
	JR NC,L2428	Jump ahead if so.

Comes here if an ASCII character

CALL L2390	HL=A*8.
LD DE,(\$5C36)	CHARS.
ADD HL,DE	Point to the character bit pattern.
POP DE	Fetch the display file address.
CALL \$FF28	Copy character into display file (via RAM Routine). Can't use routine at \$244B (ROM 0) since it does not perform a simple return.
JR L246F	Continue with next character.

Comes here if a graphic character or UDG

L2428:	CP \$90	Is it a graphic character?
	JR NC,L2430	Jump ahead if not.

Comes here if a graphic character

SUB \$7F	Reduce range to \$01-\$10.
JR L2441	Jump ahead to display the symbol.

Comes here if a UDG

L2430:	SUB \$90	Reduce range to \$00-\$6D.
	CALL L2390	HL=A*8.
	POP DE	Fetch display file address.
	CALL L1F3F	Use Normal RAM Configuration (RAM bank 0) to allow access to character bit patterns.
	PUSH DE	Save display file address.

SPECTRUM +2 ROM 0 DISASSEMBLY

LD DE,(\$5C7B)	UDG. Fetch address of UDGs.
SCF	Set carry flag to indicate need to switch back to RAM bank 7.
JR L2448	Jump ahead to locate character bit pattern and display the symbol.

Come here if (HL) was \$FE or \$FF, or with a graphic character.

At this point A=\$00 if (HL) was \$FE indicating a bug symbol, or \$01 if (HL) was \$FF indicating a null, or A=\$01-\$10 if a graphic character.

L2441:	LD DE,L254E	Start address of the graphic character bitmap table.
	CALL L2390	HL=A*8 -> \$0000 or \$0008.
	AND A	Clear carry flag to indicate no need to switch back to RAM bank 7.
L2448:	EX AF,AF'	Save switch bank indication flag.
	ADD HL,DE	Point to the symbol bit pattern data.
L244A:	POP DE	Fetch display file address. Drop through into routine below.

Copy A Character « RAM Routine »

Routine copied to RAM at \$FF36-\$FF55 by subroutine at \$248E (ROM 0).

Also used in ROM from above routine.

This routine copies 8 bytes from HL to DE. It increments HL and D after each byte, restoring D afterwards.

It is used to copy a character into the display file.

Entry: HL=Character data.

DE=Display file address.

[Called by a routine that is itself never called by this ROM]

L244B:	LD C,D	Save D.
	LD A,(HL)	
	LD (DE),A	Copy byte 1.
	INC HL	
	INC D	
	LD A,(HL)	
	LD (DE),A	Copy byte 2.
	INC HL	
	INC D	
	LD A,(HL)	
	LD (DE),A	Copy byte 3.
	INC HL	
	INC D	
	LD A,(HL)	

SPECTRUM +2 ROM 0 DISASSEMBLY

LD (DE),A	Copy byte 4.
INC HL	
INC D	
LD A,(HL)	
LD (DE),A	Copy byte 5.
INC HL	
INC D	
LD A,(HL)	
LD (DE),A	Copy byte 6.
INC HL	
INC D	
LD A,(HL)	
LD (DE),A	Copy byte 7.
INC HL	
INC D	
LD A,(HL)	
LD (DE),A	Copy byte 8.
LD D,C	Restore D. « Last byte copied to RAM »

When the above routine is used in ROM, it drops through to here.

L246B:	EX AF,AF' CALL C,L1F64	Need to switch back to RAM bank 7? If so then switch to use Workspace RAM configuration (physical RAM bank 7).
L246F:	POP HL INC HL INC DE DJNZ L2400 RET	Fetch address of string data. Move to next character. Advance to next display file column. Repeat for all requested characters.

Toggle ROMs 1 « RAM Routine »

Routine copied to RAM at \$FF28-\$FF35 by subroutine at \$248E (ROM 0).

This routine toggles to the other ROM than the one held in BANK_M.

Entry: A'= Current paging configuration.

[Called by a routine that is itself never called by this ROM]

L2475:	PUSH BC DI LD BC,\$7FFD LD A,(BANK_M) XOR \$10 OUT (C),A EI	Save BC Disable interrupts whilst paging. \$5B5C. Fetch current paging configuration. Toggle ROMs. Perform paging. Re-enable interrupts.
--------	---	---

SPECTRUM +2 ROM 0 DISASSEMBLY

EX AF,AF'

Save the new configuration in A'. « Last byte copied to RAM »

Toggle ROMs 2 « RAM Routine »

Routine copied to RAM at \$FF56-\$FF60 by subroutine at \$248E (ROM 0).

This routine toggles to the other ROM than the one specified.

It is used to page back to the original configuration.

Entry: A'= Current paging configuration.

[Called by a routine that is itself never called by this ROM]

L2483:	EX AF,AF'	Retrieve current paging configuration.
	DI	Disable interrupts whilst paging.
	LD C,\$FD	Restore Paging I/O port number.
	XOR \$10	Toggle ROMs.
	OUT (C),A	Perform paging.
	EI	Re-enable interrupts.
	POP BC	Restore BC.
	RET	« Last byte copied to RAM »

Construct 'Copy Character' Routine in RAM

This routine copies 3 sections of code into RAM to construct a single routine that can be used to copy the bit pattern for a character into the display file.

Copy \$2475-\$2482 (ROM 0) to \$FF28-\$FF35 (14 bytes).

Copy \$244B-\$246A (ROM 0) to \$FF36-\$FF55 (32 bytes).

Copy \$2483-\$248D (ROM 0) to \$FF56-\$FF60 (11 bytes).

[Never called by this ROM]

L248E:	LD HL,L2475	Point to the 'page in other ROM' routine.
	LD DE,\$FF28	Destination RAM address.
	LD BC,\$000E	
	LDIR	Copy the routine.
	PUSH HL	
	LD HL,L244B	Copy a character routine.
	LD C,\$20	
	LDIR	Copy the routine.
	POP HL	HL=\$2483 (ROM 0), which is the address of the
		'page back to original ROM' routine.
	LD C,\$0B	
	LDIR	Copy the routine.
	RET	

Set Attributes File from Screen Buffer

This routine parses the screen buffer string contents looking for colour control codes and changing the attributes file contents correspondingly.

[Called by the routine at \$23EA (ROM 0), which is itself never called by this ROM]

L24A7:	RES 0,(IY-\$39)	KSTATE+1. Signal do not invert attribute value. [Spanish 128 uses IY-\$3B]
	LD DE,\$5800	The start of the attributes file.
	LD BC,\$02C0	22 rows of 32 columns.
	LD HL,(\$FF24)	The address of the string to print.
	LD A,(\$5C8D)	ATTR_P.
	LD (\$5C8F),A	ATTR_T. Use the permanent colours.

Set Attributes for a Screen Buffer Row

L24BA:	EX AF,AF'	Save the colour byte.
--------	-----------	-----------------------

The main loop returns here on each iteration

L24BB:	PUSH BC	Save the number of characters.
	LD A,(HL)	Fetch a character from the buffer.
	CP \$FF	Is it blank?
	JR NZ,L24C9	Jump ahead if not.
	LD A,(\$5C8D)	ATTR_P. Get the default colour byte.
	LD (DE),A	Store it in the attributes file.
	INC HL	Point to next screen buffer position.
	INC DE	Point to next attributes file position.
	JR L2526	Jump ahead to handle the next character.

Not a blank character

L24C9:	EX AF,AF'	Get the colour byte.
	LD (DE),A	Store it in the attributes file.
	INC DE	Point to the next attributes file position.
	EX AF,AF'	Save the colour byte.
	INC HL	Point to the next screen buffer position.
	CP \$15	Is the string character OVER or above?
	JR NC,L2526	Jump if it is to handle the next character.
	CP \$10	Is the string character below INK?
	JR C,L2526	Jump if it is to handle the next character.

Screen buffer character is INK, PAPER, FLASH, BRIGHT or INVERSE.

SPECTRUM +2 ROM o DISASSEMBLY

DEC HL
JR NZ,L24E1

Point back to the previous screen buffer position.
Jump if not INK.

Screen character was INK so insert the new ink into the attribute byte.

INC HL
LD A,(HL)

Point to the next screen buffer position.
Fetch the ink colour from the next screen buffer position.

LD C,A
EX AF,AF'
AND \$F8
JR L2524

and store it in C.
Get the colour byte.
Mask off the ink bits.
Jump ahead to store the new attribute value and then to handle the next character.

L24E1: CP \$11
JR NZ,L24F0

Is the string character PAPER?
Jump ahead if not.

Screen character was PAPER so insert the new paper into the attribute byte.

INC HL
LD A,(HL)

Point to the next screen buffer position.
Fetch the paper colour from the next screen buffer position.

ADD A,A
ADD A,A
ADD A,A

Multiple by 8 so that ink colour become paper colour.

LD C,A
EX AF,AF'
AND \$C7
JR L2524

Get the colour byte.
Mask off the paper bits.
Jump ahead to store the new attribute value and then to handle the next character.

L24F0: CP \$12
JR NZ,L24FD

Is the string character FLASH?
Jump ahead if not.

Screen character was FLASH

INC HL
LD A,(HL)

Point to the next screen buffer position.
Fetch the flash status from the next screen buffer position.

RRCA
LD C,A
EX AF,AF'
AND \$7F
JR L2524

Shift the flash bit into bit 0.

Get the colour byte.
Mask off the flash bit.
Jump ahead to store the new attribute value and then to handle the next character.

L24FD: CP \$13
JR NZ,L250B

Is the string character BRIGHT?
Jump ahead if not.

SPECTRUM +2 ROM o DISASSEMBLY

Screen character was BRIGHT

	INC HL	Point to the next screen buffer position.
	LD A,(HL)	Fetch the bright status from the next screen buffer position.
	RRCA	
	RRCA	Shift the bright bit into bit 0.
	LD C,A	
	EX AF,AF'	Get the colour byte.
	AND \$BF	Mask off the bright bit.
	JR L2524	Jump ahead to store the new attribute value and then to handle the next character.
L250B:	CP \$14	Is the string character INVERSE?
	INC HL	Point to the next screen buffer position.
	JR NZ,L2526	Jump ahead if not to handle the next character.

Screen character was INVERSE

	LD C,(HL)	Fetch the inverse status from the next screen buffer position.
	LD A,(\$5C01)	KSTATE+1. Fetch inverting status (Bit 0 is 0 for non-inverting, 1 for inverting).
	XOR C	Invert status.
	RRA	Shift status into the carry flag.
	JR NC,L2526	Jump if not inverting to handle the next character.
	LD A,\$01	Signal inverting is active.
	XOR (IY-\$39)	KSTATE+1. Toggle the status.
	LD (\$5C01),A	KSTATE+1. Store the new status.
	EX AF,AF'	Get the colour byte.
	CALL L2532	Swap ink and paper in the colour byte.
L2524:	OR C	Combine the old and new colour values.
	EX AF,AF'	Save the new colour byte.
L2526:	POP BC	Fetch the number of characters.
	DEC BC	
	LD A,B	
	OR C	
	JP NZ,L24BB	Repeat for all characters.
	EX AF,AF'	Get colour byte.
	LD (\$5C8F),A	ATTR_T. Make it the new temporary colour.
	RET	

Swap Ink and Paper Attribute Bits

Entry: A=Attribute byte value.

Exit : A=Attribute byte value with paper and ink bits swapped.

SPECTRUM +2 ROM o DISASSEMBLY

[Called by the routine at \$24A7 (ROM 0), which is itself never called by this ROM]

L2532:	LD B,A AND \$C0 LD C,A LD A,B ADD A,A ADD A,A ADD A,A AND \$38 OR C LD C,A LD A,B RRA RRA RRA AND \$07 OR C RET	Save the original colour byte. Keep only the flash and bright bits. Shift ink bits into paper bits. Keep only the paper bits. Combine with the flash and bright bits. Get the original colour byte. Shift the paper bits into the ink bits. Keep only the ink bits. Add with the paper, flash and bright bits.

« End of Unused ROM Routines »

KEY ACTION TABLES

Editing Keys Action Table

Each editing key code maps to the appropriate handling routine.

This includes those keys which mirror the functionality of the add-on keypad; these are found by trapping the keyword produced by the keystrokes in 48K mode.

[Surprisingly there is no attempt to produce an intelligible layout instead the first 16 keywords have been used. Additionally the entries for DELETE and ENTER should probably come in the first six entries for efficiency reasons.]

L2556:	DEFB \$15	Number of table entries.
	DEFB \$0B	Key code: Cursor up.
	DEFW L2ABA	CURSOR-UP handler routine.
	DEFB \$0A	Key code: Cursor Down.
	DEFW L2ADB	CURSOR-DOWN handler routine.
	DEFB \$08	Key code: Cursor Left.
	DEFW L2AFD	CURSOR-LEFT handler routine.
	DEFB \$09	Key code: Cursor Right.
	DEFW L2B09	CURSOR-RIGHT handler routine.
	DEFB \$AD	Key code: Extend Mode + P.
	DEFW L2A75	TEN-ROWS-UP handler routine.
	DEFB \$AC	Key code: Symbol Shift + I.
	DEFW L2A4B	TEN-ROWS-DOWN handler routine.
	DEFB \$AF	Key code: Extend Mode + I.
	DEFW L29FA	WORD-LEFT handler routine.
	DEFB \$AE	Key code: Extend Mode + Shift + J.
	DEFW L2A07	WORD-RIGHT handler routine.
	DEFB \$A6	Key code: Extend Mode + N, or Graph + W.

--------	------------	---

Return to the Editor

Either as the result of a re-listing, an error or from completing the Edit Menu Print option.

[BUG - Occurs only with ZX Interface 1 attached and a BASIC line such as 1000 OPEN #4, "X" (the line number must be greater than 999). This produces the error message "Invalid device expression, 1000:1" but the message is too long to fit on a single line. When using the lower screen for editing, spurious effects happen to the bottom lines. When using the full screen editor, a crash occurs. Credit: Toni Baker, ZX Computing Monthly] [The bug is caused by system variable DF_SZ being increased to 3 as a result of the error message spilling onto an extra line. The error can be resolved by inserting a LD (IY+\$31),\$02 instruction at \$2623 (ROM 0). Credit: Paul Farrow]

L2623:	CALL L30FC	Reset Below-Screen Line Edit Buffer settings to their default values.
	CALL L3248	Reset Above-Screen Line Edit Buffer settings to their default values.
	LD A,(\$EC0E)	Fetch the mode.

	CP \$04	Calculator mode?
	RET Z	Return if so (TOGGLE has no effect in Calculator mode).
	CALL L164F	Clear Editing Display.
	LD HL,\$EC0D	Editor flags.
	RES 3,(HL)	Reset 'line altered' flag.
	LD A,(HL)	
	XOR \$40	
	LD (HL),A	Toggle screen editing area flag.
	AND \$40	
	JR Z,L26D5	Jump forward if the editing area is now the upper area.
	CALL L26DA	Set the lower area as the current editing area.
	JR L26D8	Jump forward.
L26D5:	CALL L26ED	Set the upper area as the current editing area.
L26D8:	SCF	Signal do not produce an error beep.
	RET	

Select Lower Screen

Set the lower screen as the editing area.

L26DA:	CALL L38A2	Clear lower editing area display.
	LD HL,\$EC0D	Editor flags.
	SET 6,(HL)	Signal using lower screen.

SPECTRUM +2 ROM 0 DISASSEMBLY

CALL L2E53	Reset to lower screen.
CALL L3AA9	Set default lower screen editing cursor settings.
CALL L2905	Set default lower screen editing settings.
JR L26F8	Jump ahead to continue.

Select Upper Screen

Set the upper screen as the editing area.

L26ED:	LD HL,\$EC0D	Editor flags.
	RES 6,(HL)	Signal using main screen.
	CALL L28E4	Reset Cursor Position.
	CALL L386E	Clear screen and print the "128 BASIC" banner line.
L26F8:	LD HL,(\$FC9A)	Line number at top of screen.
	LD A,H	
	OR L	Is there a line?
	CALL NZ,L3370	If there is then get the address of BASIC line for this line number.
	CALL L154E	Relist the BASIC program.
	JP L2A18	Set attribute at editing position so as to show the cursor, and return.

Produce Error Beep

This is the entry point to produce the error beep, e.g. when trying to cursor up or down past the BASIC program.

It produces a different tone and duration from the error beep of 48K mode. The change in pitch is due to the SRL A instruction at \$2709 (ROM 0), and the change in duration is due to the instruction at \$2710 (ROM 0) which loads HL with \$0C80 as opposed to \$1A90 which is used when in 48K mode. The key click and key repeat sounds are produced by entering at \$270B (ROM 0) but with A holding the value of system variable PIP. This produces the same tone as 48K mode but is of a much longer duration due to HL being loaded with \$0C80 as opposed to the value of \$00C8 used in 48K mode. The Spanish 128 uses the same key click tone and duration in 128K mode as it does in 48K mode, leading to speculation that the Spectrum 128 (and subsequent models) should have done the same and hence suffer from a bug. However, there is no reason why this should be the case, and it can easily be imagined that the error beep note duration of 48K mode would quickly become very irritating when in 128K mode where it is likely to occur far more often. Hence the reason for its shorter duration. The reason for the longer key click is less clear, unless it was to save memory by using a single routine. However, it would only have required an additional 3 bytes to set HL independently for key clicks, which is not a great deal considering there is 1/2K of unused routines at \$2355 (ROM 0). Since the INPUT command is handled by ROM 1, it produces key clicks at the 48K mode duration even when executed from 128 BASIC mode.

SPECTRUM +2 ROM o DISASSEMBLY

L2706:	LD A,(\$5C38) SRL A	RASP. Divide by 2.
--------	------------------------	-----------------------

This entry point is called to produce the key click tone. In 48K mode, the key click sound uses an HL value of \$00C8 and so is 16 times shorter than in 128K mode.

L270B:	PUSH IX LD D,\$00 LD E,A LD HL,\$0C80	Pitch. Duration.
L2713:	RST 28H DEFW BEEPER POP IX RET	\$03B5. Produce a tone.

Produce Success Beep

L2719:	PUSH IX LD DE,\$0030 LD HL,\$0300 JR L2713	Frequency*Time. Duration. Jump to produce the tone.
--------	---	---

MENU ROUTINES — PART 4

Menu Key Press Handler Routines

Menu Key Press Handler — MENU

This is executed when the EDIT key is pressed, either from within a menu or from the BASIC editor.

L2723:	CALL L2A12 LD HL,\$EC0D SET 1,(HL) DEC HL LD (HL),\$00	Remove cursor, restoring old attribute. HL points to Editor flags. Signal 'menu is being displayed'. HL=\$EC0C. Set 'current menu item' as the top item.
L272E:	LD HL,(\$F6EC) CALL L36CE SCF RET	Address of text for current menu. Display menu and highlight first item. Signal do not produce an error beep.

Menu Key Press Handler — SELECT

L2736:	LD HL,\$EC0D	HL points to Editor flags.
	RES 1,(HL)	Clear 'displaying menu' flag.
	DEC HL	HL=\$EC0C.
	LD A,(HL)	A=Current menu option index.
	LD HL,(\$F6EA)	HL points to jump table for current menu.
	PUSH HL	
	PUSH AF	
	CALL L3764	Restore menu screen area.
	POP AF	
	POP HL	
	CALL L3F75	Call the item in the jump table corresponding to the currently selected menu item.
	JP L2A18	Set attribute at editing position so as to show the cursor, and return.

Menu Key Press Handler — CURSOR UP

L274D:	SCF	Signal move up.
	JR L2751	Jump ahead to continue.

Menu Key Press Handler — CURSOR DOWN

L2750:	AND A	Signal moving down.
L2751:	LD HL,\$EC0C	
	LD A,(HL)	Fetch current menu index.
	PUSH HL	Save it.
	LD HL,(\$F6EC)	Address of text for current menu.
	CALL C,L37CD	Call if moving up.
	CALL NC,L37DC	Call if moving down.
	POP HL	HL=Address of current menu index store.
	LD (HL),A	Store the new menu index.

Comes here to complete handling of Menu cursor up and down. Also as the handler routines for Edit Menu return to 128 BASIC option and Calculator menu return to Calculator option, which simply make a return.

L2761:	SCF
	RET

L290E:	LD HL,L28F7	Default main screen editing information.
	LD DE,\$F6EE	Editing information stores.
	JP L3F61	Copy bytes.

Handle Key Press Character Code

This routine handles a character typed at the keyboard, inserting it into the Screen Line Edit Buffer as appropriate.

Entry: A=Key press character code.

L2917:	LD HL,\$EC0D	Editor flags.
	OR A	Clear carry flag. [Redundant instruction since carry flag return state never checked]
	OR A	[Redundant instruction]
	BIT 0,(HL)	Is the Screen Line Edit Buffer is full?
	JP NZ,L2A18	Jump if it is to set attribute at editing position so as to show the cursor, and return.
	RES 7,(HL)	Signal got a key press.
	SET 3,(HL)	Signal current line has been altered.
	PUSH HL	Save address of the flags.
	PUSH AF	Save key code.
	CALL L2A12	Remove cursor, restoring old attribute.
	POP AF	
	PUSH AF	Get and save key code.
	CALL L2EA7	Insert the character into the Screen Line Edit Buffer.
	POP AF	Get key code.
	LD A,B	B=Current cursor column position.

SPECTRUM +2 ROM 0 DISASSEMBLY

CALL L2B9E	Find next Screen Line Edit Buffer editable position to right, moving to next row if necessary.
POP HL	Get address of the flags.
SET 7,(HL)	Signal wait for a key.
JP NC,L2A18	Jump if new position not available to set cursor attribute at existing editing position, and return.
LD A,B	A=New cursor column position.
JP C,L2A1E	Jump if new position is editable to store editing position and print cursor. [This only needs to be JP \$2A1E (ROM 0), thereby saving 3 bytes, since a branch to \$2A18 (ROM 0) would have been taken above if the carry flag was reset]
JP L2A18	Set attribute at editing position so as to show the cursor, and return.

DELETE-RIGHT Key Handler Routine

Delete a character to the right. An error beep is not produced if there is nothing to delete.

Symbol:

Exit: Carry flag set to indicate not to produce an error beep.

L2941:	LD HL,\$EC0D	HL points to Editor flags.
	SET 3,(HL)	Indicate 'line altered'.
	CALL L2A12	Remove cursor, restoring old attribute. Exit with C=row, B=column.
	CALL L2F38	Delete character to the right, shifting subsequent rows as required.
	SCF	Signal do not produce an error beep.
	LD A,B	A=The new cursor editing position.
	JP L2A1E	Store editing position and print cursor, and then return.

DELETE Key Handler Routine

Delete a character to the left. An error beep is not produced if there is nothing to delete.

Symbol:

Exit: Carry flag set to indicate not to produce an error beep.

L2951:	LD HL,\$EC0D	HL points to Editor flags.
	RES 0,(HL)	Signal that the Screen Line Edit Buffer is not full.
	SET 3,(HL)	Indicate 'line altered'.

SPECTRUM +2 ROM o DISASSEMBLY

CALL L2A12	Remove cursor, restoring old attribute. Exit with C=row, B=column.
CALL L2B81	Select previous column position (Returns carry flag set if editable).
CCF	Signal do not produce an error beep if not editable.
JP C,L2A18	Jump if not editable to set attribute at editing position so as to show the cursor, and return.
CALL L2F38	Delete character to the right, shifting subsequent rows as required.
SCF	Signal do not produce an error beep.
LD A,B	A=The new cursor editing position.
JP L2A1E	Store editing position and print cursor, and then return.

ENTER Key Handler Routine

This routine handles ENTER being pressed. If not on a BASIC line then it does nothing. If on an unaltered BASIC line then insert a blank row after it and move the cursor to it. If on an altered BASIC line then attempt to enter it into the BASIC program, otherwise return to produce an error beep. Exit: Carry flag reset to indicate to produce an error beep.

L296A:	CALL L2A12	Remove cursor, restoring old attribute.
	PUSH AF	Save preferred column number.
	CALL L30DA	DE=Start address in Screen Line Edit Buffer of the row specified in C.
	PUSH BC	Stack current editing position.
	LD B,\$00	Column 0.
	CALL L2E67	Is this a blank row? i.e. Find editable position on this row to the right, returning column number in B.
	POP BC	Retrieve current editing position.
	JR C,L2984	Jump ahead if editable position found, i.e. not a blank row.

No editable characters on the row, i.e. a blank row

LD HL,\$0020	
ADD HL,DE	Point to the flag byte for the row.
LD A,(HL)	Fetch the flag byte.
CPL	Invert it.
AND \$09	Keep the 'first row' and 'last row' flags.
JR Z,L29A0	Jump if both flags were set indicating not on a BASIC line.

SPECTRUM +2 ROM o DISASSEMBLY

On a BASIC line

L2984:	LD A,(\$EC0D)	Editor flags.
	BIT 3,A	Has the current line been altered?
	JR Z,L2990	Jump ahead if not.

The current BASIC line has been altered

	CALL L2CB4	Enter line into program.
	JR NC,L29A5	Jump if syntax error to produce an error beep.
L2990:	CALL L2C72	Find end of the current BASIC line in the Screen Line Edit Buffer, scrolling up rows as required.
		Returns column number into B.
	CALL L2B9E	Find address of end position in current BASIC line. Returns address into HL.
	CALL L2EF4	Insert a blank line in the Screen Line Edit Buffer, shifting subsequent rows down.

Display the cursor on the first column of the next row

	LD B,\$00	First column.
	POP AF	A=Preferred column number.
	SCF	Signal do not produce an error beep.
	JP L2A1E	Store editing position and print cursor, and then return.

Cursor is on a blank row, which is not part of a BASIC line

L29A0:	POP AF	Discard stacked item.
	SCF	Signal do not produce an error beep.
	JP L2A18	Set attribute at current editing position so as to show the cursor, and return.

A syntax error occurred so return signalling to produce an error beep

L29A5:	POP AF	Discard stacked item.
	JP L2A18	Set attribute at current editing position so as to show the cursor, and return.

TOP-OF-PROGRAM Key Handler Routine

Move to the first row of the first line of the BASIC program. An error beep is not produced if there is no program.

Symbol:

SPECTRUM +2 ROM o DISASSEMBLY

Exit: Carry flag set to indicate not to produce an error beep.

L29A9:	LD A,(\$EC0E)	Fetch mode.
	CP \$04	Calculator mode?
	RET Z	Exit if so.

Editor mode

CALL L2A12	Remove cursor, restoring old attribute.
LD HL,\$0000	The first possible line number.
CALL L1F3F	Use Normal RAM Configuration (physical RAM bank 0).
RST 28H	Find address of line number 0, or the next line if it does not exist.
DEFW LINE_ADDR	\$196E. Return address in HL.
RST 28H	Find line number for specified address, and return in DE.
DEFW LINE_NO	\$1695. DE=Address of first line in the BASIC program.
CALL L1F64	Use Workspace RAM configuration (physical RAM bank 7).
LD (\$5C49),DE	E_PPC. Store the current line number.
LD A,\$0F	Paper 1, Ink 7 - Blue.
CALL L3AB7	Set the cursor colour.
CALL L154E	Relist the BASIC program.
SCF	Signal do not produce an error beep.
JP L2A18	Set attribute at editing position so as to show the cursor, and return.

END-OF-PROGRAM Key Handler Routine

Move to the last row of the bottom line of the BASIC program. An error beep is not produced if there is no program.

Symbol:

Exit: Carry flag set to indicate not to produce an error beep.

L29D1:	LD A,(\$EC0E)	Fetch mode.
	CP \$04	Calculator mode?
	RET Z	Exit if so.

Editor mode

SPECTRUM +2 ROM o DISASSEMBLY

CALL L2A12	Remove cursor, restoring old attribute.
LD HL,\$270F	The last possible line number, 9999.
CALL L1F3F	Use Normal RAM Configuration (physical RAM bank 0).
RST 28H	Find address of line number 9999, or the previous line if it does not exist.
DEFW LINE_ADDR	\$196E. Return address in HL.
EX DE,HL	DE=Address of last line number.
RST 28H	Find line number for specified address, and return in DE.
DEFW LINE_NO	\$1695. DE=Address of last line in the BASIC program.
CALL L1F64	Use Workspace RAM configuration (physical RAM bank 7).
LD (\$5C49),DE	E_PPC. Store the current line number.
LD A,\$0F	Paper 1, Ink 7 - Blue.
CALL L3AB7	Set the cursor colour.
CALL L154E	Relist the BASIC program.
SCF	Signal do not produce an error beep.
JP L2A18	Set attribute at editing position so as to show the cursor, and return.

WORD-LEFT Key Handler Routine

This routine moves to the start of the current word that the cursor is on, or if it is on the first character of a word then it moves to the start of the previous word. If there is no word to move to then signal to produce an error beep.

Symbol:

←
←

Exit: Carry flag reset to indicate to produce an error beep.

L29FA:	CALL L2A12	Remove cursor, restoring old attribute.
	CALL L2C10	Find start of the current word to the left.
	JP NC,L2A18	Jump if no word to the left to restore cursor attribute at current editing position, and return. [Could have saved 4 bytes by joining the routine below, i.e. JR \$29E7]
	LD A,B	A=New cursor column number. Carry flag is set indicating not to produce an error beep.
	JP L2A1E	Store editing position and print cursor, and then return.

WORD-RIGHT Key Handler Routine

This routine moves to the start of the next word. If there is no word to move to then signal to produce an error beep.

Symbol:

Exit: Carry flag reset to indicate to produce an error beep.

L2A07:	CALL L2A12	Remove cursor, restoring old attribute.
	CALL L2C2F	Find start of the current word to the right.
	JR NC,L2A18	Jump if no word to the right to restore cursor attribute at current editing position, and return.
	LD A,B	A=The new cursor editing column number. Carry is set indicating not to produce an error beep.
	JR L2A1E	Store editing position and print cursor, and then return.

Remove Cursor

Remove editing cursor colour from current position.

Exit: C=row number.

B=Column number.

L2A12:	CALL L2A2D	Get current cursor position (C=row, B=column, A=preferred column).
	JP L3675	Restore previous colour to character square

Show Cursor

Set editing cursor colour at current position.

Exit: C=row number.

B=Column number.

L2A18:	CALL L2A2D	Get current cursor position (C=row, B=column, A=preferred column).
	JP L3666	Set editing position character square to cursor colour to show it. [Could have saved 1 byte by using a JR instruction to join the end of the routine below]

Display Cursor

Set editing cursor position and colour and then show it.

Entry: C=Row number.

B=Column number.

A=Preferred column number.

L2A1E:	CALL L2A37	Store new editing position.
	PUSH AF	
	PUSH BC	
	LD A,\$0F	Paper 1, Ink 7 - Blue.
	CALL L3AB7	Store new cursor colour.
	POP BC	
	POP AF	
	JP L3666	Set editing position character square to cursor colour to show it.

Fetch Cursor Position

Returns the three bytes of the cursor position.

Exit : C=Row number.

B=Column number

A=Preferred column number.

L2A2D:	LD HL,\$F6EE	Editing info.
	LD C,(HL)	Row number.
	INC HL	
	LD B,(HL)	Column number.
	INC HL	
	LD A,(HL)	Preferred column number.
	INC HL	
	RET	

Store Cursor Position

Store new editing cursor position.

Entry: C=Row number.

B=Column number.

A=Preferred column number.

L2A37:	LD HL,\$F6EE	Editing information.
	LD (HL),C	Row number.

SPECTRUM +2 ROM o DISASSEMBLY

INC HL	
LD (HL),B	Column number.
INC HL	
LD (HL),A	Preferred column number.
RET	

Get Current Character from Screen Line Edit Buffer

L2A40:	PUSH HL	
	CALL L30DA	DE=Start address in Screen Line Edit Buffer of the row specified in C.
	LD H,\$00	[Could have saved 2 bytes by calling the unused routine at \$2EA1 (ROM 0)]
	LD L,B	
	ADD HL,DE	Point to the column position within the row.
	LD A,(HL)	Get character at this position.
	POP HL	
	RET	

TEN-ROWS-DOWN Key Handler Routine

Move down 10 rows within the BASIC program, attempting to place the cursor as close to the preferred column number as possible.

An error beep is produced if there is not 10 rows below.

Symbol:

↓↓

Exit: Carry flag reset to indicate to produce an error beep.

L2A4B:	CALL L2A12	Remove cursor, restoring old attribute.
	LD E,A	E=Preferred column.
	LD D,\$0A	The ten lines to move down.
L2A51:	PUSH DE	
	CALL L2B56	Move down to the next row, shifting rows up as appropriate. If moving onto a new BASIC line then
	POP DE	insert the previous BASIC line into the BASIC program if it has been altered. Returns new row number in C.
	JR NC,L2A18	Jump if there was no row below to set attribute at editing position so as to show the cursor, and return.
	LD A,E	A=Preferred column.
	CALL L2A37	Store cursor editing position.

SPECTRUM +2 ROM o DISASSEMBLY

LD B,E	B=Preferred column.
CALL L2B1F	Find closest Screen Line Edit Buffer editable position to the right else to the left, returning column number in B.
JR NC,L2A68	Jump if no editable position found on the row, i.e. a blank row.
DEC D	Decrement row counter.
JR NZ,L2A51	Repeat to move down to the next row.
LD A,E	A=Preferred column.
JR C,L2A1E	Jump if editable row exists to store editing position and print cursor, and then return. [Redundant check of the carry flag, should just be JR \$2A1E (ROM 0)]

A blank row was found below, must be at the end of the BASIC program

L2A68:	PUSH DE	
	CALL L2B31	Move back up to the previous row.
	POP DE	
	LD B,E	B=Preferred column.
	CALL L2B1F	Find closest Screen Line Edit Buffer editable position to the right else to the left, returning column number in B.
	LD A,E	A=Preferred column.
	OR A	Carry will be reset indicating to produce an error beep.
	JR L2A1E	Store editing position and print cursor, and then return.

TEN-ROWS-UP Key Handler Routine

Move up 10 rows within the BASIC program, attempting to place the cursor as close to the preferred column number as possible.

An error beep is produced if there is not 10 rows above.

Symbol:

↑↑

Exit: Carry flag reset to indicate to produce an error beep.

L2A75:	CALL L2A12	Remove cursor, restoring old attribute.
	LD E,A	E=Preferred column.
	LD D,\$0A	The ten lines to move up.
L2A7B:	PUSH DE	
	CALL L2B31	Move up to the previous row, shifting rows down as appropriate. If moving onto a new BASIC line then

SPECTRUM +2 ROM 0 DISASSEMBLY

POP DE	insert the previous BASIC line into the BASIC program if it has been altered.
JR NC,L2A18	Jump if there was no row above to set cursor attribute colour at existing editing position, and return.
LD A,E	A=Preferred column.
CALL L2A37	Store cursor editing position.

JP L2A1E	Store editing position and print cursor, and then return.

CURSOR-LEFT Key Handler Routine

Move left 1 character, stopping if the start of the first row of the first BASIC line is reached.
An error beep is produced if there is no character to the left or no previous BASIC line to move to.
Exit: Carry flag reset to indicate to produce an error beep.

L2AFD:	CALL L2A12	Remove cursor, restoring old attribute. Returns with C=row, B=column.
	CALL L2B81	Find next Screen Line Edit Buffer editable position to left, wrapping to previous row as necessary.
	JP C,L2A1E	Jump if editable position found to store editing position and print cursor, and then return.

A blank row was found above, must be at the start of the BASIC program

JP L2A18	Set cursor attribute at existing editing position, and return. Carry flag is reset indicating to produce an error beep.
----------	---

CURSOR-RIGHT Key Handler Routine

Move right 1 character, stopping if the end of the last row of the last BASIC line is reached.
 An error beep is produced if there is no character to the right or no next BASIC line to move to.
 Exit: Carry flag reset to indicate to produce an error beep.

L2B09:	CALL L2A12 CALL L2B9E	Remove cursor, restoring old attribute. Find next Screen Line Edit Buffer editable position to right, wrapping to next row if necessary.
	JP C,L2A1E	Jump if editable position found to store editing position and print cursor, and then return.

A blank row was found below, must be at the end of the BASIC program

PUSH AF CALL L2B31	Save the carry flag and preferred column number. Move up to the previous row, shifting rows down as appropriate.
LD B,\$1F CALL L2C05	Column 31. Find the last editable column position searching to the left, returning the column number in B. (Returns carry flag set if there is one)
POP AF	Carry flag is reset indicating to produce an error beep.
JP L2A1E	Store editing position and print cursor, and then return.

Edit Buffer Routines — Part 1

Find Closest Screen Line Edit Buffer Editable Position to the Right else Left

This routine searches the specified Screen Line Edit Buffer row from the specified column to the right looking for the first editable position. If one cannot be found then a search is made to the left.

Entry: B=Column number.

Exit : Carry flag set if character at specified column is editable.

B=Number of closest editable column.

HL=Address of closest editable position.

L2B1F:	PUSH DE CALL L2BFA	Find Screen Line Edit Buffer editable position from previous column (or current column if the
--------	-----------------------	---

SPECTRUM +2 ROM o DISASSEMBLY

CALL NC,L2C05

POP DE
RET

previous column does not exist) to the right,
return column position in B.
If no editable character found then search to
the left for an editable character, return column
position in B.

Find Closest Screen Line Edit Buffer Editable Position to the Left else Right

This routine searches the specified Screen Line Edit Buffer row from the specified column to the left looking for the first editable position. If one cannot be found then a search is made to the right.

Entry: B=Column number.

Exit : Carry flag set if character at specified column is editable.

B=Number of closest editable column.

HL=Address of closest editable position.

L2B28: PUSH DE
 CALL L2C05

 CALL NC,L2BFA

POP DE
RET

Find Screen Line Edit Buffer editable position to
the left, returning column position in B.
If no editable character found then search
from previous column (or current column if the
previous column does not exist) to the right,
return column position in B.

Insert BASIC Line, Shift Edit Buffer Rows Down If Required and Update Display File If Required

Called from the cursor up and down related key handlers. For example, when cursor up key is pressed the current BASIC line may need to be inserted into the BASIC program if it has been altered. It may also be necessary to shift all rows down should the upper scroll threshold be reached. If the cursor was on a blank row between BASIC lines then it is necessary to shift all BASIC lines below it up, i.e. remove the blank row.

Entry: C=Current cursor row number in the Screen Line Edit Buffer.

Exit : C=New cursor row number in the Screen Line Edit Buffer.

Carry flag set if a new row was moved to.

L2B31: CALL L2CA2

If current BASIC line has been altered and moved
off of then insert it into the program.

SPECTRUM +2 ROM o DISASSEMBLY

JR NC,L2B55	Jump if BASIC line was not inserted. [Could have saved 1 byte by using RET NC]
PUSH BC	Save the new cursor row and column numbers.
CALL L30DA	DE=Start address in Screen Line Edit Buffer of the row specified in C.
LD B,\$00	Column 0.
CALL L2E67	Is this a blank row? i.e. Find editable position on this row to the right, returning column number in B.
CALL NC,L2FA6	If no editable position found then the cursor is on a blank row so shift all BASIC lines below it up to close the gap.
POP BC	Retrieve the new cursor row and column numbers.
LD HL,\$F6F1	Point to the editing area information.
LD A,(HL)	Fetch the upper scroll threshold.
CP C	Is it on the threshold?
JR C,L2B53	Jump if on a row below the threshold.

The upper row threshold for triggering scrolling the screen has been reached so proceed to scroll down one row

PUSH BC	Save the new cursor row and column numbers.
CALL L168E	Shift all edit buffer rows down, and update display file if required.
POP BC	
RET C	Return if edit buffer rows were shifted.

The edit buffer rows were not shifted down

	LD A,C	On the top row of the editing area?
	OR A	
	RET Z	Return with carry flag reset if on the top row.
L2B53:	DEC C	Move onto the previous row.
	SCF	Signal a new row was moved to.
L2B55:	RET	

Insert BASIC Line, Shift Edit Buffer Rows Up If Required and Update Display File If Required

Called from the cursor up and down related key handlers. For example, when cursor down key is pressed the current BASIC line may need to be inserted into the BASIC program if it has been altered. It may also be necessary to shift all rows up should the lower scroll threshold be reached. If the cursor was on a blank row between BASIC lines then it is necessary to shift all BASIC lines below it up, i.e. remove the blank row.

SPECTRUM +2 ROM 0 DISASSEMBLY

Entry: C=Current cursor row number in the Screen Line Edit Buffer.

Exit : C=New cursor row number in the Screen Line Edit Buffer.

Carry flag set if a new row was moved to.

	JP L2FA6	Cursor is on a blank row so shift all BASIC lines below it up to close the gap.
L2B65:	CALL L2C8E	Insert the BASIC Line into the BASIC program if the line has been altered.
	JR NC,L2B80	Jump if the line was inserted into the program. [Could have saved 1 byte by using RET NC]

The BASIC line was not inserted into the program. C=New cursor row number, B=New cursor column number, A=New cursor preferred column number

LD HL,\$F6F1	Point to the editing area information.
INC HL	Point to the 'Bottom Row Scroll Threshold' value. [Could have saved 1 byte by using LD HL,\$F6F2]
LD A,C	Fetch the new cursor row number.
CP (HL)	Is it on the lower scroll threshold?
JR C,L2B7E	Jump if on a row above the threshold.

The lower row threshold for triggering scrolling the screen has been reached so proceed to scroll up one row

PUSH BC	Save the new cursor row and column numbers.
PUSH HL	Save the editing area information address.
CALL L1658	Shift all edit buffer rows up, and update display file if required.
POP HL	
POP BC	
RET C	Return if edit buffer rows were shifted.

The edit buffer rows were not shifted up

SPECTRUM +2 ROM o DISASSEMBLY

	INC HL	Point to the 'Number of Rows in the Editing Area' value.
	LD A,(HL)	A=Number of rows in the editing area.
	CP C	On the last row of the editing area?
	RET Z	Return with carry flag reset if on the bottom row.
L2B7E:	INC C	Move onto the next row.
	SCF	Signal a new row was moved to.
L2B80:	RET	

Find Next Screen Line Edit Buffer Editable Position to Left, Wrapping Above if Required

This routine searches to the left to see if an editable position exists. If there is no editable position available to the left on the current row then the previous row is examined from the last column position.

Entry: B=Column number.

Carry flag reset.

Exit : Carry flag set if a position to the 'left' exists.

B=Number of new editable position.

HL=Address of new editable position.

L2B81:	LD D,A	Save the key code character.
	DEC B	Back one column position.
	JP M,L2B8C	Jump if already at beginning of row.
	LD E,B	E=Column number.
	CALL L2C05	Find Screen Line Edit Buffer editable position to the left, returning column position in B.
	LD A,E	A=Column number.
	RET C	Return if the new column is editable, i.e. the cursor can be moved within this row.

Wrap above to the previous row

L2B8C:	PUSH DE	E=Store the column number.
	CALL L2B31	Move up to the previous row, shifting rows down as appropriate. If moving onto a new BASIC line then
	POP DE	insert the previous BASIC line into the BASIC program if it has been altered.
	LD A,E	A=Column number.
	RET NC	Return if there was no row above.

A row above exists

LD B,\$1F	Column 31.
-----------	------------

SPECTRUM +2 ROM o DISASSEMBLY

CALL L2C05	Find the last editable column position searching to the left, returning the column number in B. (Returns carry flag set if there is one)
LD A,B	A=Column number of the closest editable position.
RET C	Return if an editable position was found, i.e. the cursor can be moved.

Return column 0

LD A,D	Restore the key code character.
LD B,\$00	Set column position 0.
RET	[BUG] - This should really ensure the carry flag is reset to signal that no editable position to the left exists, e.g. by using OR A. Fortunately, the carry flag is always reset when this routine is called and so the bug is harmless. Credit: Paul Farrow]

Find Next Screen Line Edit Buffer Editable Position to Right, Wrapping Below if Required

This routine searches to the right to see if an editable position exists. If there is no editable position available to the right on the current row then the next row is examined from the first column position. The routine is also called when a character key has been pressed and in this case if the cursor moves to the next row then a blank row is inserted and all affected rows are shifted down.

Entry: B=Column number.

C=Row number.

Exit : Carry flag set if a position to the 'right' exists.

B=Number of closest editable column, i.e. new column number.

A=New column position, i.e. preferred column number or indentation column number.

HL=Address of the new editable position.

L2B9E:	LD D,A	Save the key code character.
	INC B	Advance to the next column position.
	LD A,\$1F	Column 31.
	CP B	
	JR C,L2BAB	Jump if reached end of row.

New position is within the row

LD E,B	E=New column number.
CALL L2BFA	Find Screen Line Edit Buffer editable position from previous column to the right, returning column position in B.

SPECTRUM +2 ROM o DISASSEMBLY

The cursor position is at the location of the error marker position

L2D6B:	LD HL,\$EC0D SET 7,(HL)	Editor flags. Set 'waiting for key press' flag.
--------	----------------------------	--

[BUG] - When moving the cursor up or down, an attempt is made to place the cursor at the same column position that it had on the previous row (the preferred column). If this is not possible then the cursor is placed at the end of the row. However, it is the intention that the preferred column is still remembered and hence an attempt is made to place the cursor at this column whenever it is subsequently moved. However, a bug at this point in the ROM causes the preferred column position for the cursor to be overwritten with random data. If the cursor was moved from its original position into its error position then the preferred column gets set to zero and the next up or down cursor movement will cause the cursor marker to jump to the left-hand side of the screen. However, if the cursor remained

SPECTRUM +2 ROM o DISASSEMBLY

in the same position then the preferred column gets set to a random value and so on the next up or down cursor movement the cursor marker can jump to a random position on the screen. The bug can be reproduced by typing a line that is just longer than one row, pressing enter twice and then cursor down. The cursor marker will probably jump somewhere in the middle of the screen. Press an arrow again and the computer may even crash. Credit: Ian Collier (+3), Andrew Owen (128)] [The bug can be fixed by pre-loading the A register with the current preferred column number. Credit: Paul Farrow.

LD A,(\$F6F0)	Fetch the preferred column position.]
CALL L2A37	Store cursor editing position.
LD A,\$17	Paper 2, Ink 7 - Red.

	LD C,(HL)	Fetch the row number of the character being examined.
	PUSH HL	
	AND \$0F	Extract the status code.

Register A:

Bit 0: 1=First row of the BASIC line off top of screen.

Bit 1: 1=On first row of the BASIC line.

Bit 2: 1=Using lower screen and only first row of the BASIC line visible.

SPECTRUM +2 ROM o DISASSEMBLY

Bit 3: 1=At end of last row of the BASIC line (always 0 at this point).

LD HL,L2DAB	Jump table to select appropriate handling routine.
CALL L3F75	Call handler routine.

Register L:

\$01 - A character was returned from the Above-Screen Line Edit Buffer row.

\$02 - A character was returned from the Screen Line Edit Buffer row.

\$04 - A character was returned from the Below-Screen Line Edit Buffer row.

\$08 - At the end of the last row of the BASIC line.

Register A holds the character fetched or 'Enter' if at the end of the BASIC line.

	LD E,L	E=Return status.
	POP HL	
	JR Z,L2D9F	Jump if no match found.
	LD A,\$0D	A='Enter' character.
L2D9F:	LD (HL),C	Save the next character position row to examine.
	DEC HL	
	LD (HL),B	Save the next character position column to examine.
	DEC HL	
	PUSH AF	Save the character.
	LD A,(HL)	Fetch the current status flags.
	AND \$F0	Keep the upper nibble.
	OR E	Update the location flags that indicate where to obtain the next character from.
	LD (HL),A	Store the status flags.
	POP AF	Retrieve the character.
	RET	

Fetch Next Character Jump Table

Jump to one of three handling routines when fetching the next character from the BASIC line to insert.

L2DAB:	DEFB \$03	Number of table entries.
	DEFB \$02	On first row of the BASIC line.
	DEFW L2DD2	
	DEFB \$04	Using lower screen and only first row of the BASIC line visible.
	DEFW L2E0F	
	DEFB \$01	First row of the BASIC line off top of screen.
	DEFW L2DB5	

Fetch Character from the Current Row of the BASIC Line in the Screen Line Edit Buffer

Fetch character from the current row of the BASIC line in the Screen Line Edit Buffer, skipping nulls until the end of the BASIC line is found.

Entry: C=Row number.

Exit : L=\$01 - A character was returned from the Above-Screen Line Edit Buffer row, with A holding the character.

\$02 - A character was returned from the Screen Line Edit Buffer row, with A holding the character.

\$04 - A character was returned from the Below-Screen Line Edit Buffer row, with A holding the character.

\$08 - At the end of the last row of the BASIC line, with A holding an 'Enter' character.

Zero flag set to indicate a match from the handler table was found.

Table entry point - First row of BASIC line off top of screen

L2DB5:	CALL L32DD	Find row address in Above-Screen Line Edit Buffer, return in DE.
L2DB8:	CALL L2E34	Fetch character from Above-Screen Line Edit Buffer row.
	JR NC,L2DC4	Jump if end of row reached.
	CP \$00	Is it a null character, i.e. not editable?
	JR Z,L2DB8	Jump back if so until character found or end of row reached.
	LD L,\$01	Signal a character was returned from the Above-Screen Line Edit Buffer row, with A holding the character.
	RET	Return with zero flag reset to indicate match found.

End of row reached - no more editable characters in Above-Screen Line Edit Buffer row

L2DC4:	INC C	Next row.
	LD B,\$00	Column 0.
	LD HL,(\$F9DB)	[BUG] - This should be LD HL,\$F9DB. The bug manifests itself when Enter is pressed on an edited BASIC line that goes off the top of the screen and causes corruption to that line. The bug at \$30F6 (ROM 0) that sets default data for the Below-Screen Line Edit Buffer implies that originally there was the intention to have a pointer into the next location to use within that buffer, and so it seems to reasonable to assume the same arrangement would have been intended for the Above-Screen Line Edit Buffer. If that were the

SPECTRUM +2 ROM o DISASSEMBLY

		case then the instruction here was intended to fetch the next address within the Above-Screen Line Edit Buffer. Credit: Ian Collier (+3), Andrew Owen (128)]
LD A,C		Fetch the row number.
CP (HL)		Exceeded last row of Above-Screen Line Edit Buffer?
JR C,L2DB5		Jump back if not exceeded last row the Above-Screen Line Edit Buffer.

All characters from rows off top of screen fetched so continue onto the rows on screen [Note it is not possible to have more than 20 rows off the top of the screen]

LD B,\$00	Column 0.
LD C,\$00	Row 0. This is the first visible row of the BASIC line on screen.

Table entry point - On visible row of BASIC line

C=Row number of the first visible row of the BASIC line in the Screen Line Edit Buffer
B=Starting column number of the first visible row of the BASIC line in the Screen Line Edit Buffer

L2DD2:	PUSH HL	Save address of the table entry.
	LD HL,\$F6EE	Point to the cursor position details.
	LD A,(HL)	Fetch the row number of the cursor.
	CP C	Is cursor on the first visible row of the BASIC line?
	JR NZ,L2DE4	Jump if not.

Cursor on first visible row of the BASIC line in the Screen Line Edit Buffer.

	INC HL	
	LD A,(HL)	Fetch the column number of the cursor.
	CP B	Reached the column with the cursor in the first visible row of the BASIC line?
	JR NZ,L2DE4	Jump if not.
	LD HL,\$EC00	BASIC line insertion flags.
	RES 7,(HL)	Indicate that the column with the cursor has been found.
L2DE4:	POP HL	Retrieve address of the table entry.
L2DE5:	CALL L30DA	DE=Start address in Screen Line Edit Buffer of the row specified in C.
	CALL L2E34	Fetch character from Screen Line Edit Buffer row at column held in B, then increment B.
	JR NC,L2DF4	Jump if end of row reached.
	CP \$00	Is the character a null, i.e. not editable?

SPECTRUM +2 ROM o DISASSEMBLY

JR Z,L2DD2	Jump back if null to keep fetching characters until a character is found or the end of the row is reached.
------------	--

A character in the current row of the BASIC line was found

LD L,\$02	L=Signal a character was returned from the Screen Line Edit Buffer row, with A holding the character.
RET	Return with zero flag reset to indicate match found.

End of row reached - no editable characters in the Screen Line Edit Buffer row

L2DF4:	LD HL,\$0020	
	ADD HL,DE	Point to the flag byte for the row.
	BIT 3,(HL)	Is it the last row of the BASIC line?
	JR Z,L2E01	Jump if not.

On last row of the BASIC line and finished fetching characters from the line

LD L,\$08	L=Signal at the end of the last row of the BASIC line.
LD A,\$0D	A='Enter' character.
RET	Return with zero flag reset to indicate match found.

Not on the last row of the BASIC line so move to the beginning of the next, if it is on screen.

L2E01:	LD HL,\$F6F3	Point to the 'top row scroll threshold' value.
	INC C	Next row of the BASIC line in the Screen Line Edit Buffer.
	LD A,(HL)	Fetch the number of the last row in the Screen Line Edit Buffer.
	CP C	Exceeded the upper scroll threshold?
	LD B,\$00	Column 0.
	JR NC,L2DE5	Jump back if not to retrieve the character from the next row.

The upper row threshold for triggering scrolling the screen has been reached so proceed to scroll up one line

LD B,\$00	Column 0. [Redundant byte]
LD C,\$01	Row 1. (Row 0 holds a copy of the last row visible on screen)

SPECTRUM +2 ROM o DISASSEMBLY

Table entry point - Using lower screen and only top row of a multi-row BASIC line is visible

L2E0F:	CALL L31E9	Find the address of the row specified by C in Below-Screen Line Edit Buffer, into DE.

	CP \$00	Is it a null (i.e. end-of-line)?
	SCF	Signal position is editable.
	RET NZ	Return if this character is part of the edited line.
L2E81:	INC HL	Advance to the next position.
	INC B	Increment the column number.
	LD A,B	
	CP \$1F	Reached the end of the row?

SPECTRUM +2 ROM o DISASSEMBLY

JR C,L2E7C

RET

Jump back if more columns to check.

Return with carry flag reset if specified column position does not exist.

Find Edit Buffer Editable Position to the Left

This routine finds the first editable character position in the specified edit buffer row from the current column to the left.

It first checks the current column and returns this if it contains an editable character. Otherwise it searches the columns to the left and if an editable character is found then it returns the column to the right of it.

Entry: B =Column number to start searching from.

DE=Start of row in edit buffer.

Exit : Carry flag set if an editable character was found.

HL=Address of closest editable position.

B =Number of the column after the editable position.

L2E89:	LD H,\$00	[Could have saved 1 byte by calling routine at \$2EA1 (ROM 0)]
	LD L,B	HL=Column number.
	ADD HL,DE	HL=Address in edit buffer of the specified column.
	LD A,(HL)	Fetch the contents.
	CP \$00	Is it a null character, i.e. end-of-line or past the end-of-line?
	SCF	Signal position is editable.
	RET NZ	Return if an editable character was found.
L2E92:	LD A,(HL)	Get the current character.

	JR NZ,L2E9E	Jump if not.
	LD A,B	At column 0?
	OR A	
	RET Z	Return if so.
	DEC HL	Next column position to test.
	DEC B	Decrement column index number.
	JR L2E92	Repeat test on previous column.
L2E9E:	INC B	Advance to the column after the editable position.
	SCF	Signal position is editable.
	RET	

Fetch Edit Buffer Row Character

Entry: DE=Add of edit buffer row.

B =Column number.

Exit : A =Character at specified column.

SPECTRUM +2 ROM o DISASSEMBLY

[Not used by the ROM]

L2EA1:	LD H,\$00	
	LD L,B	HL=Column number.
	ADD HL,DE	HL=Address in edit buffer of the specified column.
	LD A,(HL)	Get the current character.
	RET	

Insert Character into Screen Line Edit Buffer

Called when a non-action key is pressed. It inserts a character into the Screen Line Edit Buffer if there is room.

Entry: A=Character code.

B=Cursor column position.

C=Cursor row position.

L2EA7:	LD HL,\$EC0D	Editor flags.
	OR A	Clear carry flag. [Redundant since carry flag return state never checked]
	BIT 0,(HL)	Is the Screen Line Edit Buffer is full?
	RET NZ	Return if it is.
	PUSH BC	Save cursor position.
	PUSH AF	Save key code. [Redundant since \$30DA (ROM 0) preserves AF]
	CALL L30DA	DE=Start address in Screen Line Edit Buffer of the row specified in C.
	POP AF	Get key code. [Redundant since \$30DA (ROM 0) preserves AF]

Insert the character into the current row. If a spill from this row occurs then insert that character into the start of the following row and shift all existing characters right by one. Repeat this process until all rows have been shifted.

L2EB4:	CALL L16CB	Insert character into edit buffer row at current cursor position, shifting the row right. Returns carry flag reset. Zero flag will be set if byte shift out of last column position was \$00.
	PUSH AF	Save key code and flags.
	EX DE,HL	HL=Address of edit buffer row. DE=Address of flags.
	CALL L362A	Print a row of the edit buffer to the screen.
	EX DE,HL	DE=Address of edit buffer row. HL=Address of flags.
	POP AF	Get key code and flags.

SPECTRUM +2 ROM 0 DISASSEMBLY

CCF	Sets the carry flag since it was reset via the call to \$16CB (ROM 0). [Redundant since never tested]
JR Z,L2EF2	Jump ahead to make a return if there was no spill out from column 31, with the carry flag set.

There was a spill out from the current row, and so this character will need to be inserted as the first character of the following row.

If this is the last row of the BASIC line then a new row will need to be inserted.

PUSH AF	Save key code.
LD B,\$00	First column in the next row.
INC C	Next row.
LD A,(\$EC15)	The number of editing rows on screen.
CP C	Has the bottom of the Screen Line Edit Buffer been reached?
JR C,L2EEE	Jump ahead if so.

The editing screen is not full

LD A,(HL)	Fetch contents of flag byte for the row (byte after the 32 columns).
LD E,A	E=Old flags.
AND \$D7	Mask off 'last row of BASIC line' flag. [Other bits not used, could have used AND \$F7]
CP (HL)	Has the status changed?
LD (HL),A	Store the new flags, marking it as not the last BASIC row.
LD A,E	A=Original flags byte for the row.
SET 1,(HL)	Signal that the row spans onto another row.
PUSH AF	Save the flags.
CALL L30DA	DE=Start address in Screen Line Edit Buffer of the following row, as specified in C.
POP AF	Fetch the flags.
JR Z,L2EE8	Jump if the character was not inserted into the last row of the BASIC line.

The character was inserted into the last row of the BASIC line causing a spill of an existing character into a new row, and therefore a new 'last' row needs to be inserted.

RES 0,A	Signal not the first row of the BASIC line.
CALL L2EF9	Insert a blank line into the Screen Edit Buffer.
JR NC,L2EF2	Jump if the buffer is full to exit.
CALL L361A	Indent the row by setting the appropriate number of null characters in the current Screen Line Edit Buffer row.
POP AF	Get key code.

SPECTRUM +2 ROM 0 DISASSEMBLY

JR L2EB4	Jump back to insert the character in the newly inserted row. [Could have saved 2 bytes by using JR \$2EEB (ROM 0)]
----------	--

The character was not inserted into the last row of the BASIC line, so find the first editable position on the following row, i.e. skip over any indentation.

L2EE8:	CALL L2E67	Find editable position on this row from the previous column to the right, returning column number in B.
	POP AF	Get key code.
	JR L2EB4	Jump back to insert the character into the first editable position of next the row.

The Screen Edit Line Buffer is full and the character insertion requires shifting of all rows that are off screen in the Below-Screen Line Edit Buffer.

L2EEE:	POP AF	Get key code.
	CALL L3194	Insert the character at the start of the Below-Screen Line Edit Buffer, shifting all existing characters to the right.

All paths join here

L2EF2:	POP BC	Retrieve cursor position.
	RET	

Insert Blank Row into Screen Edit Buffer, Shifting Rows Down

This routine inserts a blank row at the specified row, shifting affected rows down.

Entry: C=Row number to insert the row at.

Exit: Carry flag set to indicate edit buffer rows were shifted.

L2EF4:	CALL L30DA	DE=Start address in Screen Line Edit Buffer of the row specified in C.
	LD A,\$09	Signal 'first row' and 'last row', indicating a new blank row.

DE=Address of row within Screen Line Edit Buffer.

Retrieve the flags status (zero flag set if deleting from the row matching the cursor position). A=Character to insert. Jump back if not deleting from the row matching the cursor position, i.e. all rows after the cursor have not yet been shifted.

[BUG - The 'line altered' flag is not cleared when an 'edited' null line is entered. To reproduce the bug, insert a couple of BASIC lines, type a character, delete it, and then cursor up or down onto a program line. The line is considered to have been changed and so is processed as if it consists of characters. Further, when cursor down is pressed to move to a BASIC line below, that line is deemed to have changed and hence moving off from it causing that line to be re-inserted into the BASIC program. Credit: Ian Collier (+3), Paul Farrow (128)] [The fix for the bug is to check whether all characters have been deleted from the line and if so to reset the 'line altered' flag. This would require the following code to be inserted at this point. Credit: Paul Farrow. PUSH DE LD HL,\$0020 ADD HL,DE ; Point to the flag byte for this row. POP DE BIT 0,(HL) ; First row of BASIC line in addition to the last? JR Z,SKIP_CLEAR ; Jump ahead if not. LD B,\$00 CALL \$2E67 (ROM 0) ; Is this a blank row? i.e. Find editable position on this row to the right, returning column number in B. JR C,SKIP_CLEAR ; Jump if a character exists on the line. LD HL,\$EC0D RES 3,(HL) ; Signal that the current line has not been altered. SKIP_CLEAR: XOR A ; Set the preferred column to 0.]

SCF POP BC	[Redundant since never subsequently checked] Retrieve initial cursor row and column numbers.

RET

Shift Rows Up to Close Blank Row in Screen Line Edit Buffer

The cursor is on a blank row but has been moved off of it. Therefore shift all BASIC lines below it up so as to remove the blank row.

Entry: DE=Address of the row in the Screen Line Edit Buffer containing the cursor.

C =Row number in the Screen Line Edit Buffer containing the cursor.

Carry flag set if rows were shifted up, i.e. a row below existed.

L2FA6:	LD HL,\$0020	
	ADD HL,DE	Point to the flag byte for the row.
	LD A,(HL)	
	BIT 0,(HL)	Is the cursor on a blank row (which is flagged as the first row of a BASIC line)?
	JR NZ,L2FD8	Jump ahead if it is. [Could have improved speed by jumping to \$2FDC (ROM 0) since DE already holds the start address of the row]

Cursor not on a blank row but is on its own row at the end of a multi-row BASIC line

PUSH AF	Save the cursor row flag byte.
PUSH BC	Save the cursor row number in C.
LD A,C	Is the cursor on row 0?
OR A	
JR NZ,L2FCA	Jump ahead if it is not, i.e. there is at least one row above.

Cursor on row 0, hence a BASIC line must be off the top of the screen [???? Can this ever be the case?]

PUSH BC	Save the cursor row number.
LD HL,(\$FC9A)	Line number at top of screen.
CALL L3370	Find closest line number (or \$0000 if no line).
LD (\$FC9A),HL	Line number at top of screen.
LD A,(\$F9DB)	Fetch the number of rows of the BASIC line that are in the Above-Screen Line Edit Buffer, i.e. that are off the top of the screen.
LD C,A	
DEC C	Decrement the row count, i.e. one less row off the top of the screen.
CALL L32DD	DE=Address of row in Above-Screen Line Edit Buffer.
POP BC	Retrieve the cursor row number.
JR L2FCE	Jump ahead.

SPECTRUM +2 ROM 0 DISASSEMBLY

There is a row above so set this as the last row of the BASIC line

L2FCA:	DEC C	Previous row, i.e. the last row of the BASIC line that contains editable characters.
	CALL L30DA	DE=Start address in Screen Line Edit Buffer of the previous row.
L2FCE:	POP BC	Retrieve the cursor row number.
	POP AF	Retrieve the cursor row flag byte, which indicates last row of BASIC line.
	LD HL,\$0020	Point to the flag byte for the previous row.
	ADD HL,DE	
	RES 1,(HL)	Signal that the previous row does not span onto another row.
	OR (HL)	Keep the previous row's first BASIC row flag.
	LD (HL),A	Update the flag byte for the previous row.

Shift up all rows below the old cursor position within the Screen Line Edit Buffer and including the Below-Screen Line Edit Buffer, and update the display file if required

L2FD8:	LD B,C	B=Row number in the Screen Line Edit Buffer.
	CALL L30DA	DE=Start address in Screen Line Edit Buffer of the row specified in C.
	CALL L3105	Shift up rows of the BASIC line in the Below-Screen Line Edit Buffer, or insert the next line BASIC line if buffer empty.
	JP L1667	Shift Screen Line Edit Buffer rows up from row specified by B and update the display file if required. [Could have saved 3 bytes by replacing the instructions CALL \$3105 (ROM 0) / JP \$1667 (ROM 0) with JP \$1664 (ROM 0)]

DELETE-WORD-LEFT Key Handler Routine

This routine deletes to the start of the current word that the cursor is on, or if it is on the first character of a word then it deletes to the start of the previous word. Since the function works by deleting one character at a time, display file updates are disabled whilst the function is executing to prevent screen flicker.

If there is no word to delete then an error beep is requested.

Symbol:

← DEL

Exit: Carry flag reset to indicate to produce an error beep and set not to produce an error beep.

L2FE2:	CALL L30AA	Remove cursor attribute, disable display file updates and get current cursor position. Exits with HL pointing to the editing area information.
--------	------------	--

SPECTRUM +2 ROM o DISASSEMBLY

C=Row number.

Exit : HL=Address of specified position.

[Not used by the ROM]

L30EC:	PUSH DE CALL L30DA LD H,\$00 LD L,B ADD HL,DE POP DE RET	DE=Start address in Screen Line Edit Buffer of the row specified in C. $DE = \$EC16 + \$0023 * C + B$.
--------	--	---

Below-Screen Line Edit Buffer Settings

This table holds the default values for the Below-Screen Line Edit Buffer settings starting at \$F6F5. It should only contain a table of 3 bytes to tie up with the space allocated within the Editor workspace variables at \$F6F5. As a result, the last 2 bytes will get copied into the Below-Screen Line Edit Buffer itself. It appears that the word at \$F6F6 is supposed to be a pointer to the next available or accessed location within the buffer but this facility is never used. Therefore the table need only be 1 byte long, in which case it would be more efficient for the routine at \$30FC (ROM 0) to simply set the byte at \$F6F5 directly.

L30F6:	DEFB \$05 DEFB \$00 DEFW \$0000	Number of bytes in table. $\$F6F5$ = Number of rows held in the Below-Screen Line Edit Buffer. $\$F6F6/7$. [BUG - These two bytes should not be here and the table should only contain 3 bytes. Credit: Paul Farrow]

POP DE	DE=Start address of the row in the edit buffer.
POP BC	B=Column number. C=Row number.
CALL L361A	Indent the row by setting the appropriate number of null characters.
POP AF	Get character to insert.
JR L31AA	Jump back to insert it.

SPECTRUM +2 ROM o DISASSEMBLY

The shifting of all rows has completed

L31E0:	LD A,C	Get the row number.
	LD (\$F6F5),A	Store as the number of rows held within the Below-Screen Line Edit Buffer.
	SET 3,(HL)	Mark this row as the last row of the BASIC line.
	POP DE	Restore registers.
	POP BC	
	RET	

Find Row Address in Below-Screen Line Edit Buffer

Find address in the Below-Screen Line Edit Buffer of specified row.

This routine calculates $DE = \$F6F8 + \$0023 * C$.

Entry: C=Row number.

Exit : Address of edit row in DE.

L31E9:	LD HL,\$F6F8	Address of the Below-Screen Line Edit Buffer.
	JP L30DD	Jump to find the row address and return.

Delete a Character from a BASIC Line in the Below-Screen Line Edit Buffer

Delete a character at the specified position, shifting subsequent characters left as applicable.

Exit: A=Character shifted out of the top row of the Below-Screen Line Edit Buffer.

L31EF:	PUSH BC	Save registers.
	PUSH DE	
	LD HL,\$EC0D	Editor flags.
	RES 0,(HL)	Signal that the Screen Line Edit Buffer (including Below-Screen Line Edit Buffer) is not full.
	LD A,(\$F6F5)	A=Number of rows held in the Below-Screen Line Edit Buffer.
	LD C,A	C=Number of rows held in the Below-Screen Line Edit Buffer.
	OR A	Are there any rows in the Below-Screen Line Edit Buffer?
	LD A,\$00	A null character.
	JR Z,L3241	Jump if there are no rows. [Redundant check since this routine should never be called if there are no rows in this buffer]

There is at least one row in the Below-Screen Line Edit Buffer

SPECTRUM +2 ROM o DISASSEMBLY

L31FF:	CALL L31E9	Find the address of the last used row within Below-Screen Line Edit Buffer, into DE.
	PUSH AF	Save the character to insert.
	LD B,\$00	Start searching from column 0.
	CALL L2E67	Find editable position on this row to the right, returning column number in B.
	JR NC,L3218	Jump if no editable position found, i.e. a blank row.

The row is not blank

POP AF	A=Character to insert.
--------	------------------------

DE=Address within a row of edit buffer.

A=Character to shift into right of row.

B=The column to start shifting at.

CALL L16E0	Insert the character into the end of the edit buffer row, shifting all columns left until the cursor position is reached.
PUSH AF	A=Character shifted out, zero flag set if the shifted out character was a null (\$00).
PUSH BC	Save the row number.
LD B,\$00	Start searching from column 0.
CALL L2E67	Is this now a blank row? i.e. Find editable position on this row to the right, returning column number in B.
POP BC	C=Row number.
JR C,L323C	Jump if editable position found.

The row is already blank or the result of the shift has caused it to become blank.

HL points to the last blank character in the row.

L3218:	INC HL	Point to the flag byte for the blank row.
	LD A,(HL)	Fetch the flag byte.
	PUSH AF	Save the flag byte for the blank row.
	PUSH BC	Save the row number.
	LD A,C	Fetch the row number of this blank row.
	CP \$01	Is this the first row in the Below-Screen Line Edit Buffer?
	JR NZ,L322A	Jump if not.

The first row in the Below-Screen Line Edit Buffer is empty and hence the BASIC line now fits completely on screen, i.e. within the Screen Line Edit Buffer

SPECTRUM +2 ROM o DISASSEMBLY

LD A,(\$EC15)	The number of editing rows on screen.
LD C,A	C=Bottom row number in the Screen Line Edit Buffer.
CALL L30DA	DE=Start address in Screen Line Edit Buffer of the bottom row, as specified in C.
JR L322E	Jump ahead to continue.

The blank row is not the first row in the Below-Screen Line Edit Buffer, and hence there are further rows above to be shifted

L322A:	DEC C	Previous row within the Below-Screen Line Edit Buffer.
	CALL L31E9	Find the address of the row specified by C in Below-Screen Line Edit Buffer, into DE.
L322E:	POP BC	Retrieve the row number.
	POP AF	A=Flag byte value for the blank row.
	LD HL,\$0020	
	ADD HL,DE	Point to the flag byte for the row above.
	RES 1,(HL)	Signal that the row above does not span onto another row.
	OR (HL)	Or in the flag bits from the blank row, essentially this will retain the 'last row' bit.
	LD (HL),A	Update the flag byte for the row above.
	LD HL,\$F6F5	Point to the number of rows held in the Below-Screen Line Edit Buffer.
	DEC (HL)	Decrement the row count.

Continue with the next row

L323C:	POP AF	Fetch the character shifted out from the current row, ready for insertion into the row above.
	DEC C	Previous row.
	JR NZ,L31FF	Jump back if the character shifted out was not null, i.e. more rows above to shift.

All rows in the Below-Screen Line Edit Buffer have been shifted

L3241:	SCF	[Redundant since never subsequently checked]
	POP DE	Restore registers.
	POP BC	
	RET	

Above-Screen Line Edit Buffer Settings

This table holds the default values for the Below-Screen Line Edit Buffer settings starting at \$F9DB.

SPECTRUM +2 ROM 0 DISASSEMBLY

It appears that the word at \$F9DC is supposed to be a pointer to the next available or accessed location within the buffer but this facility is never used. Therefore the table need only be 1 byte long, in which case it would be more efficient for the routine at \$3248 (ROM 0) to simply set the byte at \$F9DB directly.

L3244:	DEFB \$03	Number of bytes in table.
	DEFB \$00	\$F9DB = Number of rows held in the Above-Screen Line Edit Buffer.
	DEFW \$F9DE	\$F9DC/D = Points to next available location within the Above-Screen Line Edit Buffer.

Set Above-Screen Line Edit Buffer Settings

Sets the default values for the Above-Screen Line Edit Buffer settings.

Copy 3 bytes from \$3245-\$3247 (ROM 0) to \$F9DB-\$F9DD.

L3248:	LD HL,L3244	Default Above-Screen Line Edit Buffer settings.
	LD DE,\$F9DB	Destination address.
	JP L3F61	Copy bytes.

Shift Rows Down in the Above-Screen Line Edit Buffer

If Above-Screen Line Edit Buffer contains row then decrement the count, i.e. less rows off screen.

If the Above-Screen Line Edit Buffer is empty then load in the new BASIC line at the top of the screen.

Exit : HL=Address of next row to use within the Above-Screen Line Edit Buffer.

Carry flag reset if Above-Screen Line Edit Buffer is empty, i.e. no edit buffer rows were shifted.

L3251:	PUSH BC	Save registers.
	PUSH DE	
	LD HL,\$F9DB	Point to the Above-Screen Line Edit Buffer settings.
	PUSH HL	Save address of the Above-Screen Line Edit Buffer settings.
	LD A,(HL)	Fetch number of rows of the BASIC line that are off the top of the screen.
	OR A	Are there any rows off the top of the screen?
	JR NZ,L3279	Jump if there are.

There are no rows of the BASIC line off the top of the screen so use the top line that is visible on screen

PUSH HL	Save address of the Above-Screen Line Edit Buffer settings.
CALL L3385	Copy 'Insert Keyword Representation Into Keyword Construction Buffer' routine to RAM.

SPECTRUM +2 ROM 0 DISASSEMBLY

	LD HL,(\$FC9A)	HL=New line number at top of screen.
	CALL L3370	Verify the line number exists, or fetch the next line number if not.
	JR NC,L326A	Jump if the line does not exist.
	LD (\$FC9A),HL	Store the line number found as the one at the top of screen.
L326A:	LD B,H	
	LD C,L	BC=New line number at top of screen.
	POP HL	HL=Address of the Above-Screen Line Edit Buffer settings.
	INC HL	
	INC HL	
	INC HL	Point to the first row of the Above-Screen Line Edit Buffer.
	JR NC,L3283	Jump if the line did not exist.

The line specified as the one at the top of the screen does exist **[BUG]** - HL points to the start of the first row of the Above-Screen Line Edit Buffer but it should point to the settings fields 3 bytes earlier since the call to \$32FC (ROM 0) will advance HL by 3 bytes. The bug manifests itself when modifying a BASIC line that spans off the top of the screen. It causes corruption to the line number, causing a new BASIC line to be inserted rather than updating the line being edited. When editing lines with a high line number, the corrupted line number can end up larger 9999 and hence the line is deemed invalid when Enter is pressed to insert the line into the BASIC program. The effects of the bug are often masked by the bug at \$2DC7 (ROM 0) which performs LD HL,(\$F9DB) instead of LD HL,\$F9DB and thereby fails to detect when the end of the Above-Screen Line Edit Buffer has been reached. The bug can be fixed by inserted three DEC HL instructions before the call to \$32FC (ROM 0). Credit: Paul Farrow]

	CALL L32FC	Copy the new BASIC line into the Above-Screen Line Edit Buffer.
	DEC A	Decrement the count of the number of rows held in the Above-Screen Line Edit Buffer.
	EX DE,HL	HL=Start of the next row in the Above-Screen Line Edit Buffer.

	LD (HL),E	
	INC HL	
	LD (HL),D	Store the address of the next row to use within the Above-Screen Line Edit Buffer.
	EX DE,HL	HL=Address of next row to use within the Above-Screen Line Edit Buffer.
	POP DE	Restore registers.
	POP BC	
	RET	

Shift Row Up into the Above-Screen Line Edit Buffer if Required

This routine is used to shift up a Screen Line Edit Buffer or a Below-Screen Line Edit Buffer row into the Above-Screen Line Edit Buffer.

If shifting the top row of the Screen Line Edit Buffer would result in a straggle into the Above-Screen Line Edit Buffer then the top row is shifted into the next available location within the Above-Screen Line Edit Buffer. If the shift would place the start of a BASIC line on the top row then the Above-Screen Line Edit Buffer is set as empty.

The routine is also called when relisting the BASIC program. The first BASIC line may straggle above the screen and so it is necessary to load the BASIC line into the Above-Screen Line Edit Buffer. This is achieved by using the Below-Screen Line Edit Buffer as a temporary line workspace. This routine is called to shift each row into the Above-Screen Line Edit Buffer as appropriate.

Entry: DE=Start address of the first row in the Screen Line Edit Buffer, or start address of a Below-Screen Line Edit Buffer row.

Exit : HL=Address of next row to use within the Below-Screen or Screen Line Edit Buffer.

Carry flag set if the Line Edit Buffer if not full.

L3290:	PUSH BC	Save registers.
	PUSH DE	
	LD HL,\$0020

	EX DE,HL	
	LD HL,\$0020	
	ADD HL,DE	Point to the flag byte for the next row.
	LD (HL),\$00	Clear the flags to indicate no BASIC line on this row.
	SCF	Signal still on a row within the edit buffer.
	RET	

BASIC Line Handling Routines

Find Address of BASIC Line with Specified Line Number

This routine finds the address of the BASIC line in the program area with the specified line number, or the next line is the specified one does not exist.

Entry: HL=Line number.

Exit : Carry flag set if line exists.

DE=Points to the command of the BASIC line within the program area.

HL=Line number (\$0000 for no line number).

L3370:	CALL L34DC	Find the address of the BASIC line in the program area with the specified line number.
	RET C	Return if the line exists.
	LD HL,\$0000	No line number.
	RET	

Create Next Line Number Representation in Keyword Construction Buffer

This routine is used to create a string representation of the line number for the next line after the specified line, and store it in the Keyword Construction Buffer.

Entry: HL=Line number.

A=Print leading space flag (\$00=Print leading space).

Exit : Carry flag set to indicate specified line exists.

DE=Points to the command field of the BASIC line.

HL=Line number, or \$0000 if line does not exist.

L3378:	CALL L3456	Create next line number representation in the Keyword Construction Buffer.
	RET C	Return if line exists.
	LD HL,\$0000	Line not found.
	RET	

Fetch Next De-tokenized Character from Selected BASIC Line in Program Area

Exit: Carry flag reset if a character was available.

A=Character fetched.

SPECTRUM +2 ROM 0 DISASSEMBLY

L3380:	CALL L353D	Fetch the next de-tokenized character from the BASIC line within the program area.
	CCF	
	RET NC	Return if a character was available. [BUG - This should just be a RET. Its effect is harmless since the routine below has previously been called and hence simply overwrites the data already copied to RAM. Credit: Ian Collier (+3), Andrew Owen (128)]

Copy 'Insert Keyword Representation into Keyword Construction Buffer' Routine into RAM

Copies Insert Keyword Representation Into Keyword Construction Buffer routine into physical RAM bank 7, and resets pointers to indicate that there is no BASIC line currently being de-tokenized.

L3385:	LD HL,\$0000	Signal no line number of command.
	LD (\$FC9F),HL	Signal no further character to fetch from the BASIC line within the program area.
	LD (\$FCA1),HL	Signal no further character to fetch from the Keyword Construction Buffer.
	LD HL,L339A	Source for Insert Keyword Representation Into Keyword Construction Buffer routine.
	LD DE,\$FCAE	Destination for Insert Keyword Representation Into Keyword Construction Buffer routine.
	LD BC,\$00BC	
	LDIR	Copy the routine to RAM bank 7 at address \$FCAE.
	RET	

Insert Keyword Representation into Keyword Construction Buffer « RAM Routine »

This routine copies a keyword string from ROM 1 into the Keyword Construction Buffer, terminating it with an 'end of BASIC line' marker (code ' '+\$80). Only standard Spectrum keywords are handled by this routine (SPECTRUM and PLAY are processed elsewhere).

The routine is run from RAM bank 7 at \$FCAE so that access to both ROMs is available.

Depending on the value of A (which should be the ASCII code less \$A5, e.g. 'RND', the first (48K) keyword, has A=0), a different index into the token table is taken. This is to allow speedier lookup since there are never more than 15 keywords to advance through.

Entry: A=Keyword character code-\$A5 (range \$00-\$5A).

DE=Insertion address within Keyword Construction Buffer.

Copied to physical RAM bank 7 at \$FCAE-\$FCFC by subroutine at \$3385 (ROM 0).

Used for token range \$F5-\$FF (A >= \$50)

L33D7:	SUB \$50	
	LD HL,TOKENS+\$013F	\$01D4. Token table entry "PRINT" in ROM 1.
L33DC:	LD B,A	Take a copy of the index value.
	OR A	If A=0 then already have the entry address.
L33DE:	JR Z,L33E9	If indexed item found then jump ahead to copy the characters of the token.
L33E0:	LD A,(HL)	Fetch a character.
	INC HL	Point to next character.
	AND \$80	Has end of token marker been found?
	JR Z,L33E0	Loop back for next character if not.
	DEC B	Count down the index of the required token.
	JR L33DE	Jump back to test whether the required token has been reached.

Copy Keyword Characters « RAM Routine »

This routine copies a keyword string from ROM 1 into the Keyword Construction Buffer, terminating it with an 'end of BASIC line' marker (code ' '+\$80). A leading space will be inserted if required and a trailing space is always inserted.

The routine is run from physical RAM bank 7 so that access to both ROMs is available.

Entry: HL=Address of keyword string in ROM 1.

DE=Insertion address within Keyword Construction Buffer.

Copied to physical RAM bank 7 at \$FCFD-\$FD2D by subroutine at \$3385 (ROM 0).

L33E9:	LD DE,\$FCA3	DE=Keyword Construction Buffer.
	LD (\$FCA1),DE	Store the start address of the constructed keyword.
	LD A,(\$FC9E)	Print a leading space?
	OR A	
	LD A,\$00	
	LD (\$FC9E),A	Signal leading space not required.
	JR NZ,L33FF	Jump if leading space not required.
	LD A,\$20	Print a leading space.
	LD (DE),A	Insert a leading space.
	INC DE	Advance to next buffer position.
L33FF:	LD A,(HL)	Fetch a character of the keyword.
	LD B,A	Store it.
	INC HL	Advance to next keyword character.
	LD (DE),A	Store the keyword character in the BASIC line buffer.
	INC DE	Advance to the next buffer position.
	AND \$80	Test if the end of the keyword string.

SPECTRUM +2 ROM 0 DISASSEMBLY

JR Z,L33FF	Jump back if not to repeat for all characters of the keyword.
LD A,B	Get keyword character back.
AND \$7F	Mask off bit 7 which indicates the end of string marker.
DEC DE	Point back at the last character of the keyword copied into the buffer
LD (DE),A	and store it.
INC DE	Advance to the position in the buffer after the last character of the keyword.
LD A,' '+\$80	\$A0. Space + end marker.
LD (DE),A	Store an 'end of BASIC line so far' marker.
LD A,\$07	
LD BC,\$7FFD	
OUT (C),A	Page in ROM 0, SCREEN 0, no locking, RAM bank 7.
EI	Re-enable interrupts.
RET	

Identify Token from Table

This routine identifies the string within the Keyword Conversion Buffer and returns the character code.

The last character of the string to identify has bit 7 set.

Only 48K mode tokens are identified.

Exit: Carry flag set if token identified.

A=Character code.

Copied to RAM at \$FD2E-\$FD69 by routine at \$3385 (ROM 0).

L341A:	DI	Disable interrupts whilst paging.
	LD BC,\$7FFD	
	LD D,\$17	Select ROM 1, SCREEN 0, RAM bank 7.
	OUT (C),D	
	LD HL,TOKENS+1	\$0096. Address of token table in ROM 1.
	LD B,\$A5	Character code of the first token - 'RND'.

Entry point here used to match 128K mode tokens and mis-spelled tokens

L3427:	LD DE,\$FD74	Keyword Conversion Buffer holds the text to match against.
L342A:	LD A,(DE)	Fetch a character from the buffer.
	AND \$7F	Mask off terminator bit.
	CP \$61	Is it lowercase?
	LD A,(DE)	Fetch the character again from the buffer.
	JR C,L3434	Jump if uppercase.
	AND \$DF	Make the character uppercase.

SPECTRUM +2 ROM o DISASSEMBLY

L3434:	CP (HL)	Does the character match the current item in the token table?
	JR NZ,L3440	Jump if it does not.
	INC HL	Point to the next character in the buffer.
	INC DE	Point to the next character in the token table.
	AND \$80	Has the terminator been reached?
	JR Z,L342A	Jump back if not to test the next character in the token.

A match was found

	SCF	Signal a match was found.
	JR L344C	Jump ahead to continue.
L3440:	INC B	The next character code to test against.
	JR Z,L344B	Jump if all character codes tested.

The token does not match so skip to the next entry in the token table

L3443:	LD A,(HL)	Fetch the character from the token table.
	AND \$80	Has the end terminator been found?
	INC HL	Point to the next character.
	JR Z,L3443	Jump back if no terminator found.
	JR L3427	Jump back to test against the next token.

All character codes tested and no match found

L344B:	OR A	Clear the carry flag to indicate no match found.
--------	------	--

The common exit point

L344C:	LD A,B	Fetch the character code of the matching token (\$00 for no match).
	LD D,\$07	Select ROM 0, SCREEN 0, RAM bank 7.
	LD BC,\$7FFD	
	OUT (C),D	
	EI	Re-enable interrupts.
	RET	« Last byte copied to RAM »

Create Next Line Number Representation in Keyword Construction Buffer

This routine is used to create a string representation of the line number for the next line after the specified line, and store it in the Keyword Construction Buffer.

Entry: HL=Line number.

SPECTRUM +2 ROM o DISASSEMBLY

A=Print leading space flag (\$00=Print leading space).

Exit : Carry flag set to indicate specified line available.

DE=Points to the command field of the BASIC line.

HL=Line number.

L3456:	CALL L3510	Clear BASIC line construction pointers (address of next character in the Keyword Construction Buffer and the address of the next character in the BASIC line within the program area being de-tokenized).
	OR A	[BUG - Supposed to be XOR A to ensure that a leading space is shown before a command keyword is printed. However, most of the time the A register will enter the routine holding \$00 and so the bug is probably harmless. Credit: Paul Farrow]
	LD (\$FC9E),A	Print a leading space flag.
	CALL L1F3F	Use Normal RAM Configuration (physical RAM bank 0).
	CALL L351C	Find address of the specified BASIC line, into HL.
	JR NC,L34B7	Jump if suitable line number not found, i.e. end of program reached.
	JR NZ,L3473	Jump if line number did not match, i.e. is higher than the line requested.

The line number requested exists

LD A,B	BC=Line number.
OR C	
JR Z,L3473	Jump if the first program line requested (line number of 0).

Fetch the next line

CALL L34F5	Move to the start of the next BASIC line.
CALL L34FF	Check whether at the end of the BASIC program.
JR NC,L34B7	Jump if at the end of the BASIC program.

Insert line number into the BASIC Line Construction Buffer

L3473:	LD D,(HL)	HL=Address of the BASIC line.
	INC HL	
	LD E,(HL)	DE=Line number.
	CALL L1F64	Use Workspace RAM configuration (physical RAM bank 7).

SPECTRUM +2 ROM o DISASSEMBLY

PUSH DE	Save the line number.
PUSH HL	Save the address of the BASIC line+1.
PUSH IX	Save IX.
LD IX,\$FCA3	IX=Keyword Construction Buffer, the location where the line number will be created.
LD (\$FCA1),IX	Store the start of the buffer as the next location to store a character in.
EX DE,HL	HL=Line number.
LD B,\$00	Signal no digit printed yet.
LD DE,\$FC18	-1000.
CALL L34BB	Insert the thousand digit.
LD DE,\$FF9C	-100.
CALL L34BB	Insert the hundred digit.
LD DE,\$FFF6	-10.
CALL L34BB	Insert the ten digit.
LD DE,\$FFFF	-1.
CALL L34BB	Insert the units digits. [Note that this is not designed to handle line number 0, which technically is not supported by Sinclair BASIC. The call would need to be preceded by a LD B, \$01 instruction to make this function support a line number of 0. Credit: Ian Collier (+3), Andrew Owen (128)]
DEC IX	IX points to previous ASCII digit.
LD A,(IX+\$00)	
OR \$80	
LD (IX+\$00),A	Set bit 7 to mark it as the end of the line number representation.
POP IX	Restore registers.
POP HL	HL=Address of the BASIC line+1.
POP DE	DE=Line number.
INC HL	HL=Points to length field of the BASIC line.
INC HL	
INC HL	HL=Points to the command field of the BASIC line.
LD (\$FC9F),HL	Store it as the next character to fetch when parsing the BASIC line to de-tokenize it.
EX DE,HL	DE=Points to the command field of the BASIC line, HL=Line number.
SCF	Signal line exists.
RET	

End of program reached, no line number available

L34B7:	CALL L1F64	Use Workspace RAM configuration (physical RAM bank 7).
--------	------------	--

SPECTRUM +2 ROM o DISASSEMBLY

RET

Return with carry flag reset to signal line does not exist.

Insert ASCII Line Number Digit

Insert text representation of a line number digit in a buffer.

Insert a \$00 character for every leading zero.

Entry: DE=Subtraction amount (-1000, -100, -10, -1).

HL=Line number.

IX=Address of the buffer to write the ASCII line number to.

B=Indicates if digit printed yet (\$00=not printed).

Exit : IX points to next buffer location.

B=\$01 if digit printed.

HL=Line number remainder.

L34BB: XOR A

A=Counter.

L34BC: ADD HL,DE

Keep adding DE

INC A

and incrementing the counter
until there is no carry.

JR C,L34BC

Adjust for the last addition and.

SBC HL,DE

counter value that caused the overflow.

DEC A

A=Number of multiples of DE in the line number

ADD A,\$30

Convert to an ASCII digit.

LD (IX+\$00),A

Store in the buffer.

CP '0'

\$30. Is it a zero?

JR NZ,L34D7

Jump ahead if not.

LD A,B

Get the 'digit printed' flag.

OR A

JR NZ,L34D9

Jump ahead if already printed a digit.

LD A,\$00

Otherwise this is a leading zero, so
store a zero byte to indicate 'nothing to print'.
and jump ahead to point to the next buffer
location.

LD (IX+\$00),A

JR L34D9

L34D7: LD B,\$01

Indicate 'digit printed'.

L34D9: INC IX

Point to the next buffer location.

RET

Find Address of BASIC Line with Specified Line Number

This routine finds the address of the BASIC line in the program area with the specified line number, or the next line if the specified one does not exist.

SPECTRUM +2 ROM o DISASSEMBLY

Entry: HL=Line number.

A=\$00 to print a leading space.

Exit : Carry flag set if line exists.

DE=Points to the command of the BASIC line within the program area.

HL=Line number.

L34DC:	CALL L3510	Clear BASIC line construction pointers (address of next character in the Keyword Construction Buffer and the address of the next character in the BASIC line within the program area being de-tokenized).
	OR A	[BUG - Supposed to be XOR A to ensure that a leading space is shown before a command keyword is printed. However, most of the time the A register will enter the routine holding \$00 and so the bug is probably harmless. Credit: Paul Farrow]
	LD (\$FC9E),A	Store 'print a leading space' flag.
	CALL L1F3F	Use Normal RAM Configuration (physical RAM bank 0).
	CALL L351C	Find the address of the BASIC line with this line number, or the next line otherwise.
	JR NC,L34B7	Jump if does not exist.
	EX DE,HL	HL=Address of BASIC line.
	LD A,L	
	OR H	Address of \$0000, i.e. no line exists?
	SCF	Assume line number found.
	JP NZ,L3473	Jump if a line was found.
	CCF	Reset carry flag to indicate line number does not exist
	JR L34B7	and jump to make a return.

Move to Next BASIC Line

L34F5:	PUSH HL	Save the address of the original line.
	INC HL	Skip past the line number.
	INC HL	
	LD E,(HL)	Retrieve the line length into DE.
	INC HL	
	LD D,(HL)	
	INC HL	
	ADD HL,DE	Point to the start of the next line.
	POP DE	DE=Address of original line.
	RET	

Check if at End of BASIC Program

Check whether at the end of the BASIC program.

Entry: HL=Address of BASIC line.

Exit : Carry flag reset if end of BASIC program reached.

L34FF:	LD A,(HL)	
	AND \$C0	
	SCF	Signal not at end of BASIC.
	RET Z	Return if not at end of program.
	CCF	Signal at end of BASIC.
	RET	

Compare Line Numbers

Compare line number at (HL) has line number held in BC.

Entry: HL=Address of first line number.

BC=Second line number.

Exit : Carry flag and zero flag set if the line number matches.

Zero flag reset if no match, with carry flag set if line number held in BC is lower than the line number pointed to by HL.

L3506:	LD A,B	Test the first byte.
	CP (HL)	
	RET NZ	Return if not the same.
	LD A,C	Test the second byte.
	INC HL	
	CP (HL)	
	DEC HL	
	RET NZ	Return if not the same.
	SCF	Signal line number matches.
	RET	

Clear BASIC Line Construction Pointers

L3510:	PUSH HL	
	LD HL,\$0000	
	LD (\$FCA1),HL	Signal no next character to fetch from the Keyword Construction Buffer.
	LD (\$FC9F),HL	Signal no next character to fetch within the BASIC line in the program area.

SPECTRUM +2 ROM o DISASSEMBLY

POP HL
RET

Find Address of BASIC Line

This routine finds the address of the BASIC line within the program area with the specified line number.

Entry: HL=Line number to find (\$0000 for first program line).

Exit : Carry flag set if requested or next line exists.

Zero flag reset if no match, with carry flag set if line number is lower than the first program line number.

HL=Address of the BASIC line number, or \$0000 if line does not exist.

DE=Address of previous BASIC line number, or \$0000 if line does not exist.

BC=Line number.

L351C:	PUSH HL	
	POP BC	BC=Line number. [Quicker to have used the instructions LD B,H / LD C,L]
	LD DE,\$0000	
	LD HL,(\$5C53)	PROG. Address of the start of BASIC program.
	CALL L34FF	Test for end of BASIC program.
	RET NC	Return if at end of program.
	CALL L3506	Compare line number at (HL) with BC.
	RET C	Return if line number matches or is lower than the first program line number.
	LD A,B	
	OR C	
	SCF	
	RET Z	Return with carry and zero flags set if first program line was requested (line number 0).
L3530:	CALL L34F5	Get address of next BASIC line.
	CALL L34FF	Test for end of BASIC program.
	RET NC	Return if at end of program.
	CALL L3506	Compare line number at (HL) with BC.
	JR NC,L3530	If line number not the same or greater then back to test next line.
	RET	Exit with carry flag set if line found.

Fetch Next De-tokenized Character from BASIC Line in Program Area

This routine translates a tokenized BASIC line within the program area into the equivalent 'typed' line, i.e. non-tokenized.

SPECTRUM +2 ROM o DISASSEMBLY

The line number has been previously converted into a string representation and is held within the Keyword Construction Buffer at \$FCA3. On each call of this routine, the next character of the BASIC line representation is fetched. Initially this is the line number characters from the Keyword Construction Buffer, and then the characters from the program line itself. As a token character is encountered, it is converted into its string representation and stored in the Keyword Construction Buffer. Then each character of this string is fetched in turn. Once all of these characters have been fetched, the next character will be from the last position accessed within the BASIC line in the program area.

Exit: Carry flag set to indicate that a character was available.

A=Character fetched.

L353D:	LD HL,(\$FCA1)	Fetch the address of the character within the Keyword Construction Buffer.
	LD A,L	
	OR H	Is there an address defined, i.e. characters still within the buffer to fetch?
	JR Z,L3562	Jump ahead if not.

There is a character within the Keyword Construction Buffer

	LD A,(HL)	Fetch a character from the buffer.
	INC HL	Point to the next character.
	CP ' '+\$80	\$A0. Was it a trailing space, i.e. the last character?
	LD B,A	Save the character.
	LD A,\$00	Signal 'print a leading space'.
	JR NZ,L354F	Jump ahead if not.
	LD A,\$FF	Signal 'do not print a leading space'.
L354F:	LD (\$FC9E),A	Store the 'print a leading space' flag value.
	LD A,B	Get the character back.
	BIT 7,A	Is it the last character in the buffer, i.e. the terminator bit is set?
	JR Z,L355A	Jump ahead if not.
	LD HL,\$0000	Signal no more characters within the Keyword Construction Buffer to fetch.
L355A:	LD (\$FCA1),HL	Store the address of the next line number/keyword character within the construction buffer, or \$0000 if no more characters.
	AND \$7F	Mask off the terminator bit.
	JP L35B5	Jump ahead to continue. [Could have saved 1 byte by using JR \$35B5 (ROM 0)]

There is no line number/keyword defined within the buffer so fetch the next tokenized character from the BASIC line in the program area

L3562:	LD HL,(\$FC9F)	Fetch the address of the next character within the BASIC line construction workspace.
--------	----------------	---

SPECTRUM +2 ROM o DISASSEMBLY

	LD A,L	
	OR H	Is there a character defined, i.e. end of line not yet reached?
	JP Z,L35B7	Jump ahead if not. [Could have saved 1 byte by using JR \$35B7 (ROM 0)]
	CALL L1F3F	Use Normal RAM Configuration (physical RAM bank 0).
L356D:	LD A,(HL)	Fetch a character from the buffer.
	CP \$0E	Is it the hidden number marker indicating a floating-point representation?
	JR NZ,L357A	Jump ahead if it is not.
	INC HL	Skip over it the floating-point representation.
	INC HL	
	INC HL	
	INC HL	
	INC HL	
	INC HL	
	JR L356D	Jump back to fetch the next character.
L357A:	CALL L1F64	Use Workspace RAM configuration (physical RAM bank 7).
	INC HL	Point to the next character.
	LD (\$FC9F),HL	Store the address of the next command within the BASIC line to fetch.
	CP \$A5	'RND'. Is the current character a standard '48K' keyword? ('RND' = first 48K keyword)
	JR C,L358D	Jump ahead if not.
	SUB \$A5	Reduce command code range to \$00-\$5A.

[BUG] - The routine assumes all tokens require a leading and trailing space. However, this is not true for tokens '<=', '>=' and '<>'. Credit: Ian Collier (+3), Paul Farrow (128)]

[To fix the bug, the call to \$FCAE would need to be replaced with code such as the following. Credit: Paul Farrow.

*PUSH AF
CALL \$FCAE*

Construct a string representation of the keyword in the Keyword Construction Buffer.

	DEFB 'N'+\$80
	DEFM "OPEN"

SPECTRUM +2 ROM 0 DISASSEMBLY

```
DEFB '#'+$80
DEFM "CLOSE"
DEFB '#'+$80
```

Indentation Settings

Copied to \$FD6A-\$FD6B.

L35DF:	DEFB \$02	Number of bytes in table.
	DEFB \$01	Flag never subsequently used. Possibly intended to indicate the start of a new BASIC line and hence whether indentation required.
	DEFB \$05	Number of characters to indent by.

Set Indentation Settings

L35E2:	LD HL,L35DF	HL=Address of the indentation settings data table.
	LD DE,\$FD6A	Destination address.
	JP L3F61	Copy two bytes from \$35DF-\$35E0 (ROM 0) to \$FD6A-\$FD6B.

Store Character in Column of Edit Buffer Row

Store character in the specified column of the current edit buffer row.

Entry: B=Column number.

DE=Start address of row.

A=Character to insert.

Exit : B=Next column number.

L35EB:	LD L,B	Point to the required column.
	LD H,\$00	Store the character.
	ADD HL,DE	Advance to the next column.
	LD (HL),A	
	INC B	
	RET	

'Enter' Action Handler Routine

L35F2:	CALL L360C	Null remaining column positions in the edit buffer row.
	LD A,(HL)	Fetch the flag byte.
	OR \$18	Signal associated line number and last row in the BASIC line.
	LD (HL),A	Update the flag byte.
	LD HL,\$FD6A	[Redundant since flag never subsequently tested. Deleting these instructions would have saved 5 bytes]
	SET 0,(HL)	Flag possibly intended to indicate the start of a new BASIC line and hence whether indentation required.
	SCF	Signal no more characters are available, i.e. end of line.
	RET	

'Null Columns' Action Handler Routine

L3600:	CALL L360C	Null remaining column positions in the edit buffer row.
	SET 3,(HL)	Signal last row of the BASIC line in the row flag byte.
	LD HL,\$FD6A	[Redundant since flag never subsequently tested. Deleting these instructions would have saved 5 bytes]
	SET 0,(HL)	Flag possibly intended to indicate the start of a new BASIC line and hence whether indentation required.
	SCF	Signal no more characters are available, i.e. end of line.
	RET	

Null Column Positions

This routine inserts null characters into the remainder of a line edit buffer row.

Entry: B=Initial column to null.

DE=Address of start of edit row.

Exit : HL=Address of the row's flag byte.

SPECTRUM +2 ROM o DISASSEMBLY

L360C:	LD L,B	
	LD H,\$00	HL=Number of columns.
	ADD HL,DE	Point to column position in line edit buffer row.
	LD A,\$20	32 columns.
L3612:	CP B	Found specified column?
	RET Z	Return if so.
	LD (HL),\$00	Store a null in the location.
	INC HL	Next buffer position.
	INC B	Increment column position counter.
	JR L3612	Repeat for next column.

Indent Edit Buffer Row

Indent a row by setting the appropriate number of characters in an edit buffer row to nulls, i.e. character \$00.

Entry: DE=Address of row within edit buffer.

Exit : B=First usable column number in the row.

L361A:	LD A,(\$FD6B)	Get the number of indentation columns.
	LD B,\$00	Start at first column.
L361F:	LD H,\$00	
	LD L,B	HL=Column position.
	ADD HL,DE	
	LD (HL),\$00	Put a null in the column position.
	INC B	Next position.

	DEFB \$F7	'RUN'.

Parse a Line Renumbering Line Number References

This routine examines a BASIC line for any tokens that may be followed by a line number reference and if one is found then the new line number if calculated and substituted for the old line number reference. Although checks are made to ensure an out of memory error does not occur, the routine

SPECTRUM +2 ROM o DISASSEMBLY

simply returns silently in such scenarios and the renumber routine will continue onto the next BASIC line.

Entry: HL=Address of current character in the current BASIC line.

A=Current character.

L392F:	INC HL	Point to the next character.
	LD (HD_11+1),HL	\$5B79. Store it.
	EX DE,HL	DE=Address of next character.
	LD BC,\$0007	There are 7 tokens that may be followed by a line number, and these are listed in the table at \$3928 (ROM 0).
	LD HL,L3928	
	CPIR	Search for a match for the current character.
	EX DE,HL	HL=Address of next character.
	RET NZ	Return if no match found.

A token that might be followed by a line number was found. If it is followed by a line number then proceed to renumber the line number reference. Note that the statements such as GO TO VAL "100" will not be renumbered. The line numbers of each BASIC line will be renumbered as the last stage of the renumber process at \$38F3 (ROM 0).

	LD C,\$00	Counts the number of digits in the current line number representation. B will be \$00 from above.
L3940:	LD A,(HL)	Fetch the next character.
	CP ' '	\$20. Is it a space?
	JR Z,L3960	Jump ahead if so to parse the next character.
	RST 28H	
	DEFW NUMERIC	\$2D1B. Is the character a numeric digit?
	JR NC,L3960	Jump if a numeric digit to parse the next character.
	CP ':'	\$2E. Is it a decimal point?
	JR Z,L3960	Jump ahead if so to parse the next character.
	CP \$0E	Does it indicate a hidden number?
	JR Z,L3964	Jump ahead if so to process it.
	OR \$20	Convert to lower case.
	CP 'e'	\$65. Is it an exponent 'e'?
	JR NZ,L395C	Jump if not to parse the next character.
	LD A,B	Have any digits been found?
	OR C	
	JR NZ,L3960	Jump ahead to parse the next character.

A line number reference was not found

L395C:	LD HL,(HD_11+1)	\$5B79. Retrieve the address of the next character.
	RET	
L3960:	INC BC	Increment the number digit counter.

SPECTRUM +2 ROM o DISASSEMBLY

INC HL JR L3940	Point to the next character. Jump back to parse the character at this new address.

EDITOR ROUTINES — PART 5

Tokenize BASIC Line

This routine serves two purposes. The first is to tokenize a typed BASIC line into a tokenized version. The second is when a syntax error is subsequently detected within the tokenized line, and it is then used to search for the position within the typed line where the error marker should be shown.

This routine parses the BASIC line entered by the user and generates a tokenized version in the workspace area as pointed to by system variable E_LINE.

It suffers from a number of bugs related to the handling of '>' and '<' characters. The keywords '<>', '>=' and '<=' are the only keywords that do not commence with letters and the routine traps these in a different manner to all other keywords. If a '<' or '>' is encountered then it is not immediately copied to the BASIC line workspace since the subsequent character must be examined as it could be a '>' or '=' character and therefore might form the keywords '<>', '>=' or '<='. A problem occurs if the subsequent character is a letter since the parser now expects the start of a possible keyword. It should at this

SPECTRUM +2 ROM o DISASSEMBLY

point insert the '<' or '>' into the BASIC line workspace but neglects to do this. It is only when the next non-letter character is encountered that the '<' or '>' gets inserted, but this is now after the previously found string has been inserted. This results the following types of errors:

'PRINT varA>varB' is seen by the parser as 'PRINT varAvarB>' and hence a syntax error occurs.

'PRINT varA>varB1' is seen by the parser as 'PRINT varAvarB>1' and hence is accepted as a valid statement.

A work-around is to follow the '<' or '>' with a space since this forces the '<' or '>' to be inserted before the next potential keyword is examined.

A consequence of shifting a '<' or '>' is that a line such as 'PRINT a\$b\$b\$' is seen by the parser as 'PRINT a\$b\$b\$>' and so it throws a syntax error.

The parser saved the '>' character for consideration when the next character was examined to see if it was part of the keywords '<>', '>=' or '<=', but fails to discard it if the end of the statement is immediately encountered. Modifying the statement to a form that will be accepted will still cause a syntax error since the parser mistakenly believes the '>' character applies to this statement.

The parser identifies string literals contained within quotes and will not tokenize any keywords that appear inside them, except for the keywords "<>", "<=" and ">=" which it neglects to check for. Keywords are also not tokenized following a REM statement, except again for "<>", "<=" and ">=", until the end of the line is reached. This differs slightly to 48K BASIC mode. In 48K BASIC mode, typing a ':' following a REM statement will cause a change from 'L' cursor mode to 'K' cursor mode and hence the next key press results in a keyword token being inserted. In 128K BASIC mode, typing a ':' will not change to 'K' cursor mode and hence the next key press will just be the letter, number or symbol. This does not affect the running of the program since 48K BASIC mode will ignore all characters after a REM command until the end of the line. However, creating such a REM statement in 128K BASIC mode that appears similar to one created in 48K BASIC mode will result in more memory being used since the 'keyword' must be spelled out letter by letter.

When being used to locate the error marker position, the same process is performed as when tokenizing but no characters are actually inserted into the workspace (they are still there from when the line was originally tokenized). Instead, a check is made after each character is processed to see if the error marker address held in system variable X_PTR has been reached. If it does match then the routine returns with BC holding the character position where the error marker should be displayed at. Entry point - A syntax error was detected so the error marker must be located

L3C0A:	LD A,\$01	Signal to locate the error marker.
	JR L3C10	Jump forward.

Entry point - Tokenize the BASIC line

L3C0E:	LD A,\$00	Signal to tokenize the BASIC line. [Could have saved 1 byte by using XOR A]
L3C10:	LD (\$FD8A),A	Store the 'locate error marker' flag.
	LD HL,\$0000	
	LD (\$FD85),HL	Reset count of the number of characters in the typed BASIC line being inserted.
	LD (\$FD87),HL	Reset count of the number of characters in the tokenized version of the BASIC line being inserted.

SPECTRUM +2 ROM 0 DISASSEMBLY

ADD HL,SP	Store the stack pointer.
LD (\$FD8B),HL	Clear BASIC line construction pointers (address of next character in the Keyword Construction Buffer and the address of the next character in the BASIC line within the program area being de-tokenized).
CALL L3510	[Could have saved 1 byte by using XOR A]
LD A,\$00	Signal last character was not a keyword and was not a space. [BUG] - Should reset the '<' and '>' store at \$FD89 to \$00 here. Attempting to insert a BASIC line such as 'PRINT VAL a\$b' will fail since the parser does not like '>' immediately after 'a\$', due to the bug at \$3C5F (ROM 0). The parser stores the '>' in \$FD89 since it will check the following character in case it should replace the two characters with the token '<>', '>=' or '<='. After the parser throws the syntax error, it does not clear \$FD89 and so even if the line is modified such that it should be accepted, e.g. 'PRINT VAL a\$=b', the parser believes the line is really '>PRINT VAL n\$b' and so throws another syntax error. Since a letter follows the '>', the contents of \$FD89 will get cleared and hence a second attempt to insert the line will now succeed. Credit: Paul Farrow]
LD (\$FD84),A	
LD HL,\$FD74	HL=Start address of the Keyword Conversion Buffer.

	LD A,L	
	OR H	Is there an address set?
	JP NZ,L3CC5	Jump if so to copy the first word into the BASIC line workspace and the move the second word to the start of the Keyword Conversion Buffer. Further characters can then be appended and the contents re-evaluated in case a complete keyword is then available.

Copy the Keyword Conversion Buffer into the BASIC line workspace

L3C73:	PUSH BC	Save the character to insert.
	CALL L3D74	Copy Keyword Conversion Buffer contents into BASIC line workspace.
	POP BC	Retrieve the character to insert.
	LD A,\$00	
	LD (\$FD81),A	Signal the Keyword Conversion Buffer is empty.

C=\$01 if not a space, not a letter, not a '#' and not a '\$'.

\$02 if a '#' or '\$'.

\$03 if a space.

\$06 if a letter.

B=Character fetched.

L3C7D:	LD A,C	Retrieve the character status value.
--------	--------	--------------------------------------

SPECTRUM +2 ROM o DISASSEMBLY

AND \$01	Is it a space, or not a letter and not a '#' and not a '\$'?
JR NZ,L3C5A	Jump back if so to insert the character either into the Keyword Conversion Buffer or the BASIC line workspace.

The string was too long to be a keyword and was followed by a space, a '#' or a '\$'. Enter a loop to insert each character of the string into the BASIC line workspace.

LD A,B	Retrieve the character to insert.
CALL L3DBD	Insert character into BASIC line workspace.
RET NC	Return if tokenizing is complete.
LD HL,(\$FD85)	
INC HL	Increment the count of the number of characters in the typed BASIC line being inserted.
LD (\$FD85),HL	
CALL L3D44	Fetch the next character from BASIC line being inserted.
LD C,A	Save the flags.
JR L3C7D	Jump back to insert the character of the non-keyword string into the BASIC line workspace.

The character is not a letter so insert directly into the BASIC line workspace

L3C94:	LD A,B	Retrieve the character to insert.
	CALL L3DBD	Insert character into BASIC line workspace, tokenizing '<>', '<=' and '>=' if encountered.
	RET NC	Return if tokenizing is complete.
	JR L3C48	Jump back to fetch and process the next character.

Keyword Conversion buffer flags are set - either the buffer already contains characters, or within quotes or within a REM statement

L3C9B:	CP \$01	Is the Keyword Conversion Buffer empty or the contents marked as being within quotes or within a REM?
	JR NZ,L3C94	Jump back if so to insert the character since this is either the first character of a new word or is within quotes or within a REM.

C=\$01 if not a space, not a letter, not a '#' and not a '\$'.

\$02 if a '#' or '\$'.

\$03 if a space.

\$06 if a letter.

SPECTRUM +2 ROM o DISASSEMBLY

LD A,C	Retrieve the character status value.
AND \$01	Is it a letter or a '#' or a '\$'?
JR Z,L3C5F	Jump if so to simply insert the character.

The character is a space, or is not a letter and not a '#' and not a '\$', i.e. the last character was the end of a potential keyword

	PUSH BC	Save the next character to insert and the character status value.
L3CA5:	CALL L3F25	Attempt to identify the string in Keyword Conversion Buffer.
	POP BC	Retrieve the next character to insert and the character status value.
	JR C,L3D24	Jump if keyword identified.

The string in the Keyword Conversion Buffer was not identified as a keyword

LD HL,(\$FD7F)	Fetch the address of the space character between words within the Keyword Conversion Buffer.
LD A,H	
OR L	Is there an address set, i.e. a space between words?
JR NZ,L3CC5	Jump if there is a space character.
LD A,C	Retrieve the character status value.
AND \$02	Is it a space?
JR Z,L3C73	Jump if not to copy Keyword Conversion Buffer into the workspace since it is not a keyword.

Character is a space. Allow this as the keyword could be DEF FN, GO TO, GO SUB, etc.

CALL L3D90	Insert the character into the Keyword Conversion Buffer.
JR NC,L3C6B	Jump back if no room to insert the character, i.e. not a keyword since too large.
LD HL,(\$FD7D)	Fetch the next location address.
DEC HL	Point back to the last character.
LD (\$FD7F),HL	Store as the address of the space character. This is used for double keywords such as DEF FN.
JR L3C48	Jump back to fetch and process the next character.

The string in the Keyword Conversion Buffer contains two words separated by a space that do not form a valid double keyword (such as DEF FN, GO SUB, GO TO, etc).

For a BASIC line such as 'IF FLAG THEN' the Keyword Conversion Buffer holds the characters 'FLAG THEN'.

SPECTRUM +2 ROM o DISASSEMBLY

The 'FLAG' characters get moved to the workspace and the 'THEN' characters are shifted to the start of the Keyword Conversion Buffer before being re-evaluated to see if they form a keyword.

L3CC5:	PUSH BC	Save the character to insert and the character status value.
	LD HL,\$FD74	Point to the start address of the Keyword Conversion Buffer.
	LD DE,(\$FD7F)	Fetch the address of the space character between words within the Keyword Conversion Buffer.
	LD A,D	
	CP H	Is the space possibly at the start of the buffer?
	JR NZ,L3CD6	Jump if not.
	LD A,E	
	CP L	Is the space at the start of the buffer?
	JR NZ,L3CD6	Jump if not.
	INC DE	Point to the next location within the buffer, counter-acting the following decrement.
L3CD6:	DEC DE	Point to the previous location within the buffer.
	JR L3CDA	Jump ahead to copy all characters to the BASIC line workspace.

Copy all characters from the Keyword Conversion Buffer prior to the space into the BASIC line workspace

L3CD9:	INC HL	Point to the next location within the Keyword Conversion Buffer.
L3CDA:	LD A,(HL)	Fetch a character from the Keyword Conversion Buffer.
	AND \$7F	Mask off the terminator bit.
	PUSH HL	HL=Location within Keyword Conversion Buffer.
	PUSH DE	DE=Location of last character within the Keyword conversion Buffer.
	CALL L3DBD	Insert character into BASIC line workspace, including a stored '<' or '>' character.
	POP DE	
	POP HL	
	LD A,H	
	CP D	Possibly reached the character prior to the space?
	JR NZ,L3CD9	Jump back if not to copy the next character.
	LD A,L	
	CP E	Reached the character prior to the space?
	JR NZ,L3CD9	Jump back if not to copy the next character.

Now proceed to handle the next word

SPECTRUM +2 ROM o DISASSEMBLY

LD DE,(\$FD7F)	DE=Address of the space character between words.
LD HL,\$FD74	
LD (\$FD7F),HL	Set the address of the space character to be the start of the buffer.
LD BC,(\$FD7D)	BC=Next location within the Keyword Conversion Buffer.
DEC BC	Point to the last used location.
LD A,D	
CP H	Is the space possibly at the start of the buffer?
JR NZ,L3D17	Jump if not.
LD A,E	
CP L	Is the space at the start of the buffer?
JR NZ,L3D17	Jump if not.

The space character is at the start of the Keyword Conversion Buffer

INC DE	DE=Address after the space character within the Keyword Conversion Buffer.
PUSH HL	HL=Start address of the Keyword Conversion Buffer.
LD HL,\$0000	
LD (\$FD7F),HL	Signal no space character between words.
POP HL	HL=Start address of the Keyword Conversion Buffer.
LD A,B	
CP H	Is the space possibly the last character in the buffer?
JR NZ,L3D17	Jump if not.
LD A,C	
CP L	Is the space the last character in the buffer?
JR NZ,L3D17	Jump if not.
POP BC	Retrieve the character to insert and the character status value.
JR L3D36	Jump ahead to continue.

The space is not at the start of the Keyword Conversion Buffer, i.e. the buffer contains another word after the space.

The first word has already been copied to the BASIC line workspace so now copy the second word to the start of the Keyword Conversion Buffer and then see if it is a valid keyword. [It is not recommended to name a variable as per a keyword since statements such as 'PRINT then' will fail the syntax check since the variable 'then' is interpreted as the keyword 'THEN' and so the statement is seen as 'PRINT THEN', which in this case is invalid.] HL points to the start of the Keyword Conversion Buffer. DE points to the space between the two words.

L3D17:	LD A,(DE)	Fetch a character from the second word.
--------	-----------	---

SPECTRUM +2 ROM o DISASSEMBLY

otherwise a return is made to the main calling routine with BC holding the number of characters in the typed BASIC line,
i.e. the error marker location is at the end of the line.

L3DBD: PUSH AF Save the character to insert.

[BUG - The string characters "<>", "<=" and ">=" get tokenized to a single character '<>', '<=' and '>=' respectively even within quotes or a REM statement. Credit: Paul Collins (+3), Paul Farrow (128)]

[BUG - 128 BASIC mode handles a colon character found following a REM statement differently to 48K mode. In 48K mode, typing a colon returns the cursor into 'K' mode and hence the next key press inserts a keyword token. In 128K mode, typing a colon does not cause the characters following it to be interpreted as a possible keyword. There is no noticeable difference when executing the REM statement since subsequent statements are ignored following a REM command. However, for consistency the 128K mode editor ought to generate identical BASIC lines to those that would be created from 48K mode. 	LD A,E	Retrieve the character to insert.
	CALL L3EA2	Insert the character into the BASIC line workspace.
	RET	

Insert a Character into BASIC Line Workspace

This routine is called for two purposes. The first use is for inserting a character or token into the BASIC line workspace (situated at E_LINE).

The second use is after a syntax error has been identified within the tokenized BASIC line in the workspace and the location of the error marker needs to be established. For the second case, the system variable X_PTR holds the address of where the error occurred within the tokenized BASIC line in the workspace.

SPECTRUM +2 ROM o DISASSEMBLY

The Editor needs to identify how many characters there are before the equivalent error position is reached within the typed BASIC line. To locate it, the typed BASIC line is re-parsed but this time without inserting any characters into the BASIC line workspace, since this still contains the tokenized line from before. This tokenized line will now also include embedded floating point numbers for any numeric literals contained within the BASIC line. As the typed line is re-parsed, a count of the characters examined so far is kept and instead of inserting tokenized characters within the BASIC line workspace, a check is made to see whether the insertion location has reached the address of the error marker. If it has then the parsing of the BASIC line terminates and the count of the typed line characters indicates the equivalent position within it of the error. However, should the last character have been a token then the typed line count will also include the number of characters that form the keyword, and so this must be subtracted from the count.

Entry: A=Character to insert.

DE=Address of insertion position within the BASIC line workspace.

Exit : If searching for the error marker position and it is found then a return is made directly to the top level calling routine with BC holding the number of characters in the typed BASIC line prior to the equivalent error marker position.

L3EA2:	LD HL,(\$FD87)	
	INC HL	Increment the count of the number of characters in the tokenized BASIC line.
	LD (\$FD87),HL	
	LD HL,(\$FD82)	HL=Address of next insertion position in the BASIC line workspace.

Searching for the error marker so need to consider embedded floating point numbers

[BUG - This should fetch the next character from the tokenized BASIC line and not the current character. This routine is called to process every visible character in the BASIC line, but is not called for embedded floating point numbers. It must therefore test whether the current character is followed by an embedded floating point number and if so to skip over it. The routine does make an attempt to detect embedded floating point numbers but incorrectly performs the test on the visible character and not the character that follows it. The bug can be fixed as replacing the LD A,(HL) instruction with the following instructions. Credit: Paul Farrow.

INC HL	Advance to the next character in the tokenized BASIC line.
LD A,(HL)	Fetch the next character in the tokenized BASIC line.
DEC HL	Point back to the current character in the tokenized BASIC line.]

REFERENCE INFORMATION — PART 2

Routines Copied/Constructed in RAM

Construct Keyword Representation

This routine copies a keyword string from ROM 1 into the BASIC Line Construction Buffer, terminating it with an 'end of BASIC line' marker (code ' '+\$80). Only standard Spectrum keywords are handled by this routine (SPECTRUM and PLAY are processed elsewhere).

The routine is run from RAM bank 7 at \$FCAE so that access to both ROMs is available.

Depending on the value of A (which should be the ASCII code less \$A5, e.g. 'RND', the first (48K) keyword, has A=0), a different index into the token table is taken. This is to allow speedier lookup since there are never more than 15 keywords to advance through.

Entry: A=Keyword character code-\$A5 (range \$00-\$5A).

DE=Insertion address within BASIC Line Construction Buffer.

Copied to physical RAM bank 7 at \$FCAE-\$FCFC by routine at \$3385 (ROM 0).

\$FCAE	DI	Disable interrupts whilst paging.
	LD BC,\$7FFD	
	LD D,\$17	Page in ROM 1, SCREEN 0, no locking, RAM bank 7.
	OUT (C),D	
	CP \$50	Was the token \$F5 or above?
	JR NC,\$FCEB	
	CP \$40	Was the token \$E5 or above?

SPECTRUM +2 ROM o DISASSEMBLY

JR NC,\$FCE4	
CP \$30	Was the token \$D5 or above?
JR NC,\$FCDD	
CP \$20	Was the token \$C5 or above?
JR NC,\$FCD6	
CP \$10	Was the token \$B5 or above?
JR NC,\$FCCF	

Used for token range \$A5-\$B4 (\$00 <= A <= \$0F)

LD HL,\$0096	Token table entry 'RND' in ROM 1.
JR \$FCF0	

Used for token range \$B5-\$C4 (\$10 <= A <= \$1F)

\$FCCF	SUB \$10	
	LD HL,\$00CF	Token table entry 'ASN' in ROM 1.
	JR \$FCF0	

Used for token range \$C5-\$D4 (\$20 <= A <= \$2F)

\$FCD6	SUB \$20	
	LD HL,\$0100	Token table entry 'OR' in ROM 1.
	JR \$FCF0	

Used for token range \$D5-\$E4 (\$30 <= A <= \$3F)

\$FCDD	SUB \$30	
	LD HL,\$013E	Token table entry 'MERGE' in ROM 1.
	JR \$FCF0	

Used for token range \$E5-\$F4 (\$40 <= A <= \$4F)

\$FCE4	SUB \$40	
	LD HL,\$018B	Token table entry 'RESTORE' in ROM 1.
	JR \$FCF0	

Used for token range \$F5-\$FF (A >= \$50)

\$FCEB	SUB \$50	
	LD HL,\$01D4	Token table entry 'PRINT' in ROM 1.
\$FCF0	LD B,A	Take a copy of the index value.
	OR A	If A=0 then already have the entry address.
\$FCF2	JR Z,\$FCFD	If indexed item found then jump ahead to copy the characters of the token.

SPECTRUM +2 ROM 0 DISASSEMBLY

\$FCF4	LD A,(HL)	Fetch a character.
	INC HL	Point to next character.
	AND \$80	Has end of token marker been found?
	JR Z,\$FCF4	Loop back for next character if not.
	DEC B	Count down the index of the required token.

Copy Keyword Characters

This routine copies a keyword string from ROM 1 into the BASIC Line Construction Buffer, terminating it with an 'end of BASIC line' marker (code ' '+\$80).

The routine is run from RAM bank 7 so that access to both ROMs is available.

Entry: HL=Address of keyword string in ROM 1.

DE=Insertion address within BASIC Line Construction Buffer.

Copied to physical RAM bank 7 at \$FCFD-\$FD2D by subroutine at \$3385 (ROM 0).

\$FCFD	LD DE,\$FCA3	DE=Keyword Construction Buffer.
	LD (\$FCA1),DE	Store the start address of the constructed keyword.
	LD A,(\$FC9E)	Print a leading space?
	OR A	
	LD A,\$00	
	LD (\$FC9E),A	Signal leading space not required.
	JR NZ,\$FD13	Jump if leading space not required.
	LD A,\$20	Print a leading space.
	LD (DE),A	Insert a leading space.
	INC DE	Advance to next buffer position.
\$FD13	LD A,(HL)	Fetch a character of the keyword.
	LD B,A	Store it.
	INC HL	Advance to next keyword character.
	LD (DE),A	Store the keyword character in the BASIC line buffer.
	INC DE	Advance to the next buffer position.
	AND \$80	Test if the end of the keyword string.
	JR Z,\$FD13	Jump back if not to repeat for all characters of the keyword.
	LD A,B	Get keyword character back.
	AND \$7F	Mask of bit 7 which indicates the end of string marker.
	DEC DE	Point back at the last character of the keyword copied into the buffer
	LD (DE),A	and store it.
	INC DE	Advance to the position in the buffer after the last character of the keyword.
	LD A,' '+\$80	\$A0. ' ' + end marker
	LD (DE),A	Store an 'end of BASIC line so far' marker.

SPECTRUM +2 ROM 0 DISASSEMBLY

```
LD A,$07
LD BC,$7FFD
OUT (C),A
```

Page in ROM 0, SCREEN 0, no locking, RAM bank 7.

```
EI
```

Re-enable interrupts.

Identify Token

This routine identifies the string within the Keyword Conversion Buffer and returns the character code. The last character of the string to identify has bit 7 set.

Exit: Carry flag set if token identified.

B=Character code.

Copied to physical RAM bank 7 at \$FD2E-\$FD69 by subroutine at \$3385 (ROM 0).

\$FD2E	DI	Disable interrupts whilst paging.
	LD BC,\$7FFD	
	LD D,\$17	Select ROM 1, SCREEN 0, RAM bank 7.
	OUT (C),D	
	LD HL,\$0096	Address of token table in ROM 1.
	LD B,\$A5	Character code of the first token - 'RND'.

Entry point here used to match 128K mode tokens and mis-spelled tokens

\$FD3B	LD DE,\$FD74	Keyword Conversion Buffer holds the text to match against.
\$FD3E	LD A,(DE)	Fetch a character from the buffer.
	AND \$7F	Mask off terminator bit.
	CP \$61	Is it lowercase?
	LD A,(DE)	Fetch the character again from the buffer.
	JR C,\$FD48	Jump if uppercase.
	AND \$DF	Make the character uppercase.
\$FD48	CP (HL)	Does the character match the current item in the token table?
	JR NZ,\$FD54	Jump if it does not.
	INC HL	Point to the next character in the buffer.
	INC DE	Point to the next character in the token table.
	AND \$80	Has the terminator been reached?
	JR Z,\$FD3E	Jump back if not to test the next character in the token.

A match was found

	SCF	Signal a match was found.
	JR \$FD60	Jump ahead to continue.
\$FD54	INC B	The next character code to test against.

SPECTRUM +2 ROM 0 DISASSEMBLY

JR Z,\$FD5F

Jump if all character codes tested.

The token does not match so skip to the next entry in the token table

\$FD57	LD A,(HL) AND \$80 INC HL JR Z,\$FD57 JR \$FD3B	Fetch the character from the token table. Has the end terminator been found? Point to the next character. Jump back if no terminator found. Jump back to test against the next token.
--------	---	---

All character codes tested and no match found

\$FD5F	OR A	Clear the carry flag to indicate no match found.
--------	------	--

The common exit point

\$FD60	LD A,B LD D,\$07 LD BC,\$7FFD OUT (C),D EI	Fetch the character code of the matching token (\$00 for no match). Select ROM 0, SCREEN 0, RAM bank 7. Re-enable interrupts.
--------	--	--

Insert Character into Display File

Copy a character into the display file.

Entry: HL=Character data.

DE=Display file address.

This routine is constructed from three segments and stitched together in physical RAM bank 7 to form a single routine.

Created in physical RAM Bank 7 at \$FF28-\$FF60 by routine at \$248E (ROM 0). [Construction routine never actually called by the ROM]

\$FF28	PUSH BC DI LD BC,\$7FFD LD A,(BANK_M) XOR \$10 OUT (C),A EI EX AF,AF' LD C,D LD A,(HL) LD (DE),A	Save BC Disable interrupts whilst paging. \$5B5C. Fetch current paging configuration. Toggle ROMs. Perform paging. Re-enable interrupts. Save the new configuration in A'. Save D. Copy byte 1.

POP BC	Restore BC.

Standard Error Report Codes

0 — OK	Successful completion, or jump to a line number bigger than any existing.
1 — NEXT without FOR	The control variable does not exist (it has not been set up by a FOR statement), but there is an ordinary variable with the same name.

SPECTRUM +2 ROM o DISASSEMBLY

2 — Variable not found	For a simple variable, this will happen if the variable is used before it has been assigned to by a LET, READ or INPUT statement, loaded from disk (or tape), or set up in a FOR statement. For a subscripted variable, it will happen if the variable is used before it has been dimensioned in a DIM statement, or loaded from disk (or tape).
3 — Subscript wrong	A subscript is beyond the dimension of the array or there are the wrong number of subscripts.
4 — Out of memory	There is not enough room in the computer for what you are trying to do.
5 — Out of screen	An INPUT statement has tried to generate more than 23 lines in the lower half of the screen. Also occurs with 'PRINT AT 22,xx'.
6 — Number too big	Calculations have yielded a number greater than approximately 10^{38} .
7 — RETURN without GO SUB	There has been one more RETURN than there were GO SUBs.
8 — End of file	Input returned unacceptable character code.
9 — STOP statement	After this, CONTINUE will not repeat the STOP but carries on with the statement after.
A — Invalid argument	The argument for a function is unsuitable.
B — Integer out of range	When an integer is required, the floating point argument is rounded to the nearest integer. If this is outside a suitable range, then this error results.
C — Nonsense in BASIC	The text of the (string) argument does not form a valid expression.
D — BREAK - CONT repeats	BREAK was pressed during some peripheral operation.
E — Out of DATA	You have tried to READ past the end of the DATA list.
F — Invalid file name	SAVE with filename empty or longer than 10 characters.
G — No room for line	There is not enough room left in memory to accommodate the new program line.
H — STOP in INPUT	Some INPUT data started with STOP.
I — FOR without NEXT	A FOR loop was to be executed no times (e.g. FOR n=1 TO 0) and corresponding NEXT statement could not be found.
J — Invalid I/O device	Attempting to input characters from or output characters to a device that doesn't support it.
K — Invalid colour	The number specified is not an appropriate value.
L — BREAK into program	BREAK pressed. This is detected between two statements.
M — RAMTOP no good	The number specified for RAMTOP is either too big or too small.
N — Statement lost	Jump to a statement that no longer exists.

O — Invalid Stream	Trying to input from or output to a stream that isn't open or that is out of range (0...15), or trying to open a stream that is out of range.
P — FN without DEF	User-defined function used without a corresponding DEF in the program.
Q — Parameter error	Wrong number of arguments, or one of them is the wrong type.
R — Tape loading error	A file on tape was found but for some reason could not be read in, or would not verify.

Standard System Variables

These occupy addresses \$5C00-\$5CB5.

KSTATE	\$5C00	8	IY-\$3A	Used in reading the keyboard.
LASTK	\$5C08	1	IY-\$32	Stores newly pressed key.
REPDEL	\$5C09	1	IY-\$31	Time (in 50ths of a second) that a key must be held down before it repeats. This starts off at 35.
REPPER	\$5C0A	1	IY-\$30	Delay (in 50ths of a second) between successive repeats of a key held down - initially 5.
DEFADD	\$5C0B	2	IY-\$2F	Address of arguments of user defined function (if one is being evaluated), otherwise 0.
K_DATA	\$5C0D	1	IY-\$2D	Stores second byte of colour controls entered from keyboard.
TVDATA	\$5C0E	2	IY-\$2C	Stores bytes of colour, AT and TAB controls going to TV.
STRMS	\$5C10	38	IY-\$2A	Addresses of channels attached to streams.
CHARS	\$5C36	2	IY-\$04	256 less than address of character set, which starts with ' ' and carries on to '©'.
RASP	\$5C38	1	IY-\$02	Length of warning buzz.
PIP	\$5C39	1	IY-\$01	Length of keyboard click.
ERR_NR	\$5C3A	1	IY+\$00	1 less than the report code. Starts off at 255 (for -1) so 'PEEK 23610' gives 255.
FLAGS	\$5C3B	1	IY+\$01	Various flags to control the BASIC system: Bit 0: 1=Suppress leading space. Bit 1: 1=Using printer, 0=Using screen. Bit 2: 1=Print in L-Mode, 0=Print in K-Mode. Bit 3: 1=L-Mode, 0=K-Mode. Bit 4: 1=128K Mode, 0=48K Mode. [Always 0 on 48K Spectrum] Bit 5: 1=New key press code available in LAST_K. Bit 6: 1=Numeric variable, 0=String variable. Bit 7: 1=Line execution, 0=Syntax checking.
TVFLAG	\$5C3C	1	IY+\$02	Flags associated with the TV: Bit 0 : 1=Using lower editing area, 0=Using main screen. Bit 1-2: Not used (always 0). Bit 3 : 1=Mode might have changed.

SPECTRUM +2 ROM o DISASSEMBLY

				Bit 4 : 1=Automatic listing in main screen, 0=Ordinary listing in main screen.
				Bit 5 : 1=Lower screen requires clearing after a key press.
				Bit 6 : 1=Tape Loader option selected (set but never tested). [Always 0 on 48K Spectrum]
				Bit 7 : Not used (always 0).
ERR_SP	\$5C3D	2	IY+\$03	Address of item on machine stack to be used as error return.
LISTSP	\$5C3F	2	IY+\$05	Address of return address from automatic listing.
MODE	\$5C41	1	IY+\$07	Specifies cursor type: \$00='L' or 'C'. \$01='E'. \$02='G'. \$04='K'.
NEWPPC	\$5C42	2	IY+\$08	Line to be jumped to.
NSPPC	\$5C44	1	IY+\$0A	Statement number in line to be jumped to.
PPC	\$5C45	2	IY+\$0B	Line number of statement currently being executed.
SUBPPC	\$5C47	1	IY+\$0D	Number within line of statement currently being executed.
BORDCR	\$5C48	1	IY+\$0E	Border colour multiplied by 8; also contains the attributes normally used for the lower half of the screen.
E_PPC	\$5C49	2	IY+\$0F	Number of current line (with program cursor).
VAR5	\$5C4B	2	IY+\$11	Address of variables.
DEST	\$5C4D	2	IY+\$13	Address of variable in assignment.
CHANS	\$5C4F	2	IY+\$15	Address of channel data.
CURCHL	\$5C51	2	IY+\$17	Address of information currently being used for input and output.
PROG	\$5C53	2	IY+\$19	Address of BASIC program.
NXTLIN	\$5C55	2	IY+\$1B	Address of next line in program.
DATADD	\$5C57	2	IY+\$1D	Address of terminator of last DATA item.
E_LINE	\$5C59	2	IY+\$1F	Address of command being typed in.
K_CUR	\$5C5B	2	IY+\$21	Address of cursor.
CH_ADD	\$5C5D	2	IY+\$23	Address of the next character to be interpreted - the character after the argument of PEEK, or the NEWLINE at the end of a POKE statement.
X_PTR	\$5C5F	2	IY+\$25	Address of the character after the '?' marker.
WORKSP	\$5C61	2	IY+\$27	Address of temporary work space.
STKBOT	\$5C63	2	IY+\$29	Address of bottom of calculator stack.
STKEND	\$5C65	2	IY+\$2B	Address of start of spare space.
BREG	\$5C67	1	IY+\$2D	Calculator's B register.
MEM	\$5C68	2	IY+\$2E	Address of area used for calculator's memory (usually MEMBOT, but not always).
FLAGS2	\$5C6A	1	IY+\$30	Flags: Bit 0 : 1=Screen requires clearing.

SPECTRUM +2 ROM o DISASSEMBLY

				Bit 1 : 1=Printer buffer contains data.
				Bit 2 : 1=In quotes.
				Bit 3 : 1=CAPS LOCK on.
				Bit 4 : 1=Using channel 'K'.
				Bit 5-7: Not used (always 0).
DF_SZ	\$5C6B	1	IY+\$31	The number of lines (including one blank line) in the lower part of the screen.
S_TOP	\$5C6C	2	IY+\$32	The number of the top program line in automatic listings.
OLDPPC	\$5C6E	2	IY+\$34	Line number to which CONTINUE jumps.
OSPPC	\$5C70	1	IY+\$36	Number within line of statement to which CONTINUE jumps.
FLAGX	\$5C71	1	IY+\$37	Flags: Bit 0 : 1=Simple string complete so delete old copy. Bit 1 : 1=Indicates new variable, 0=Variable exists. Bit 2-4: Not used (always 0). Bit 5 : 1=INPUT mode. Bit 6 : 1=Numeric variable, 0=String variable. Holds nature of existing variable. Bit 7 : 1=Using INPUT LINE.
STRLEN	\$5C72	2	IY+\$38	Length of string type destination in assignment.
T_ADDR	\$5C74	2	IY+\$3A	Address of next item in syntax table.
SEED	\$5C76	2	IY+\$3C	The seed for RND. Set by RANDOMIZE.
FRAMES	\$5C78	3	IY+\$3E	3 byte (least significant byte first), frame counter incremented every 20ms.
UDG	\$5C7B	2	IY+\$41	Address of first user-defined graphic. Can be changed to save space by having fewer user-defined characters.
COORDS	\$5C7D	1	IY+\$43	X-coordinate of last point plotted.
	\$5C7E	1	IY+\$44	Y-coordinate of last point plotted.
P_POSN	\$5C7F	1	IY+\$45	33-column number of printer position.
PR_CC	\$5C80	2	IY+\$46	Full address of next position for LPRINT to print at (in ZX Printer buffer). Legal values \$5B00 - \$5B1F. [Not used in 128K mode]
ECHO_E	\$5C82	2	IY+\$48	33-column number and 24-line number (in lower half) of end of input buffer.
DF_CC	\$5C84	2	IY+\$4A	Address in display file of PRINT position.
DF_CCL	\$5C86	2	IY+\$4C	Like DF CC for lower part of screen.
S_POSN	\$5C88	1	IY+\$4E	33-column number for PRINT position.
	\$5C89	1	IY+\$4F	24-line number for PRINT position.
SPOSNL	\$5C8A	2	IY+\$50	Like S_POSN for lower part.
SCR_CT	\$5C8C	1	IY+\$52	Counts scrolls - it is always 1 more than the number of scrolls that will be done before stopping with 'scroll?'.

SPECTRUM +2 ROM o DISASSEMBLY

ATTR_P	\$5C8D	1	IY+\$53	Permanent current colours, etc, as set up by colour statements.
MASK_P	\$5C8E	1	IY+\$54	Used for transparent colours, etc. Any bit that is 1 shows that the corresponding attribute bit is taken not from ATTR_P, but from what is already on the screen.
ATTR_T	\$5C8F	1	IY+\$55	Temporary current colours (as set up by colour items).
MASK_T	\$5C90	1	IY+\$56	Like MASK_P, but temporary.
P_FLAG	\$5C91	1	IY+\$57	Flags: Bit 0: 1=OVER 1, 0=OVER 0. Bit 1: Not used (always 0). Bit 2: 1=INVERSE 1, 0=INVERSE 0. Bit 3: Not used (always 0). Bit 4: 1=Using INK 9. Bit 5: Not used (always 0). Bit 6: 1=Using PAPER 9. Bit 7: Not used (always 0).
MEMBOT	\$5C92	30	IY+\$58	Calculator's memory area - used to store numbers that cannot conveniently be put on the calculator stack.
	\$5CB0	2	IY+\$76	Not used on standard Spectrum. [Used by ZX Interface 1 Edition 2 for printer WIDTH]
RAMTOP	\$5CB2	2	IY+\$78	Address of last byte of BASIC system area.
P_RAMT	\$5CB4	2	IY+\$7A	Address of last byte of physical RAM.

Memory Map

The conventional memory is used as follows:

I Register

The I register is used along with the R register by the Z80 for automatic memory refreshing. Setting the I register to a value between \$40 and \$7F causes memory refreshes to occur to the lower 16K RAM. This RAM is contended with the ULA which uses it for the generation of the video display.

The memory refreshes get interpreted by the ULA as the CPU requesting to access the lower 16K RAM bank very rapidly and very often. The ULA is not able to handle reads at such a high frequency, with the consequence that it fails to fetch and output the next screen byte. Instead it re-uses the byte previously read. This causes a visible corruption to the video display output, often referred to as 'snow', although no actual corruption occurs to the video display RAM. This also happens when the I register is set to a value between \$C0 and \$FF when a contended RAM bank is paged in and, unlike the Spectrum 16K/48K, can lead to a machine crash.

Screen File Formats

The two screens available on the Spectrum +2, the normal screen in RAM bank 5 (\$4000-\$5AFF) and the shadow screen in RAM bank 7 (\$C000-\$FFFF), both use the same file format.

Display File

The display file consists of 3 areas, each consisting of 8 characters rows, with each row consisting of 8 pixel lines.

Each pixel line consists of 32 cell columns, with each cell consisting of a byte that represents 8 pixels.

The address of a particular cell is formed as follows:

s	1	0	a	a	l	l	l	r	r	r	c	c	c	c	c
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

Bit: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

where: s = Screen (0-1: 0=Normal screen, 1=Shadow Screen)

aa = Area (0-2)

rrr = Row (0-7)

lll = Line (0-7)

cccc = Column (0-31)

An area value of 3 denotes the attributes file, which consists of a different format.

Attributes File

The attributes file consists of 24 characters rows, with each row consisting of 32 cell columns.

Each cell consisting of a byte that holds the colour information.

The address of a particular cell is formed as follows:

s	1	0	1	1	0	r	r	r	r	r	r	c	c	c	c	c
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

Bit: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

where: s = Screen (0-1: 0=Normal screen, 1=Shadow Screen)

rrrrr = Row (0-23)

cccc = Column (0-31)

Each cell holds a byte of colour information:

SPECTRUM +2 ROM o DISASSEMBLY

f	b	p	p	p	i	i	i
---	---	---	---	---	---	---	---

Bit: 7 6 5 4 3 2 1 0

where: f = Flash (0-1: 0=Off, 1=On)

b = Bright (0-1: 0=Off, 1=On)

ppp = Paper (0-7: 0=Black, 1=Blue, 2=Red, 3=Magenta, 4=Green, 5=Cyan, 6=Yellow, 7=White)

iii = Ink (0-7: 0=Black, 1=Blue, 2=Red, 3=Magenta, 4=Green, 5=Cyan, 6=Yellow, 7=White)

Address Conversion Between Display File and Attributes File

The address of the attribute cell corresponding to an address in the display file can be constructed by moving bits 11 to 12 (the area value) to bit positions 8 to 9, setting bit 10 to 0 and setting bits 11 to 12 to 1.

The address of the display file character cell corresponding to an address in the attributes file can be constructed by moving bits 8 to 9 (the row value) to bit positions 11 to 12, and then setting bits 8 to 9 to 0.

Standard I/O Ports

Port \$FE

This controls the cassette interface, the speaker, the border colour and is used to read the keyboard. Since it is the ULA that controls these facilities, it will introduce a delay when accessing the port if it is busy at the time, and hence I/O port \$FE is subject to contention.

OUTPUT:

Bit 0-2: Border colour (0=Black, 1=Blue, 2=Red, 3=Magenta, 4=Green, 5=Cyan, 6=Yellow, 7=White).

Bit 3 : MIC output (1=Off, 0=On).

Bit 4 : Speaker output (1=On, 0=Off).

Bit 5-7: Not used.

INPUT:

Upper byte selects keyboard row to read.

	Bit0	Bit1	Bit2	Bit3	Bit4	Bit4	Bit3	Bit2	Bit1	Bit0	
\$F7FE	1	2	3	4	5	6	7	8	9	0	\$EFFE
\$FBFE	Q	W	E	R	T	Y	U	I	O	P	\$DFFE
\$FDFE	A	S	D	F	G	H	J	K	L	ENTER	\$BFFE
\$FEFE	SHIFT	Z	X	C	V	B	N	M	SYM	SPACE	\$7FFE

Bit 0-4 : Key states (corresponding bit is 0 if the key is pressed).

Bit 5 : Not used (always 1).

Bit 6 : EAR input.

Bit 7 : Not used (always 1).

Cassette Header Format

A file consists of a header block followed by a data block. Each block begins with a flag that indicates whether it is a header block or a data block. Next are the header or data bytes, and finally a checksum of the flag and header/data bytes.

Flag - A value of \$00 for a header and \$FF for a data block.

Bytes - The bytes forming the header information or the file data.

Checksum - An XOR checksum of the Flag and Bytes fields.

The header information consists of 17 bytes and these describe the size and type of data that the data block contains.

The header bytes have the following meaning:

Byte \$00 : File type - \$00=Program, \$01=Numeric array, \$02=Character array, \$03=Code/Screen\$.

Bytes \$01-\$0A: File name, padding with trailing spaces.

Bytes \$0B-\$0C: Length of program/code block/screen\$/array (\$1B00 for screen\$).

Bytes \$0D-\$0E: For a program, it holds the auto-run line number (\$80 in byte \$0E if no auto-run).

For code block/screen\$ it holds the start address (\$4000 for screen\$).

For an array, it holds the variable name in byte \$0E.

Bytes \$0F-\$10: Offset to the variables (i.e. length of program) if a program.

AY-3-8912 Programmable Sound Generator Registers

This is controlled through output I/O port \$FFFD. It is driven from a 1.77345 MHz clock.

The datasheet for the AY-3-8912 lists to the registers in octal, but below they are listed in decimal.

Registers 0 and 1 (Channel A Tone Generator)

Forms a 12 bit pitch control for sound channel A. The basic unit of tone is the clock frequency divided by 16, i.e. 110.841 kHz. With a 12 bit counter range, 4095 different frequencies from 27.067 Hz to 110.841 kHz (in increments of 27.067 Hz) can be generated.

Bits 0-7 : Contents of register 0.

Bits 8-11 : Contents of lower nibble of register 1.

Bits 12-15: Not used.

Registers 2 and 3 (Channel B Tone Generator)

Forms a 12 bit pitch control for sound channel B.

Bits 0-7 : Contents of register 2.

Bits 8-11 : Contents of lower nibble of register 3.

Bits 12-15: Not used.

Registers 4 and 5 (Channel C Tone Generator)

Forms a 12 bit pitch control for sound channel C.

Bits 0-7 : Contents of register 4.

Bits 8-11 : Contents of lower nibble of register 5.

Bits 12-15: Not used.

Register 6 (Noise Generator)

The frequency of the noise is obtained in the PSG by first counting down the input clock by 16 (i.e. 110.841 kHz), then by further counting down the result by the programmed 5 bit noise period value held in bits 0-4 of register 6. With a 5 bit counter range, 31 different frequencies from 3.576 kHz to 110.841 kHz (in increments of 3.576 kHz) can be generated.

Register 7 (Mixer — I/O Enable)

This controls the enable status of the noise and tone mixers for the three channels, and also controls the I/O port used to drive the RS232 and Keypad sockets.

Bit 0: Channel A Tone Enable (0=enabled).

Bit 1: Channel B Tone Enable (0=enabled).

Bit 2: Channel C Tone Enable (0=enabled).

Bit 3: Channel A Noise Enable (0=enabled).

Bit 4: Channel B Noise Enable (0=enabled).

Bit 5: Channel C Noise Enable (0=enabled).

Bit 6: I/O Port Enable (0=input, 1=output).

Bit 7: Not used.

Register 8 (Channel A Volume)

This controls the volume of channel A.

Bits 0-4: Channel A volume level.

Bit 5 : 1=Use envelope defined by register 13 and ignore the volume setting.

Bits 6-7: Not used.

Register 9 (Channel B Volume)

This controls the volume of channel B.

Bits 0-4: Channel B volume level.

Bit 5 : 1=Use envelope defined by register 13 and ignore the volume setting.

Bits 6-7: Not used.

Register 10 (Channel C Volume)

This controls the volume of channel C.

Bits 0-4: Channel C volume level.

Bit 5 : 1=Use envelope defined by register 13 and ignore the volume setting.

Bits 6-7: Not used.

Register 11 and 12 (Envelope Period)

These registers allow the frequency of the envelope to be selected.

The frequency of the envelope is obtained in the PSG by first counting down the input clock by 256 (6.927 kHz), then further counting down the result by the programmed 16 bit envelope period value.

SPECTRUM +2 ROM o DISASSEMBLY

With a 16 bit counter range, 65535 different frequencies from 1.691 Hz to 110.841 kHz (in increments of 1.691 Hz) can be generated.

Bits 0-7 : Contents of register 11.

Bits 8-15: Contents of register 12.

Register 13 (Envelope Shape)

This register allows the shape of the envelope to be selected.

The envelope generator further counts down the envelope frequency by 16, producing a 16-state per cycle envelope pattern. The particular shape and cycle pattern of any desired envelope is accomplished by controlling the count pattern of the 4 bit counter and by defining a single cycle or repeat cycle pattern.

Bit 0 : Hold.

Bit 1 : Alternate.

Bit 2 : Attack.

Bit 3 : Continue.

Bits 4-7: Not used.

These control bits can produce the following envelope waveforms:

Bit: 3 2 1 0

Register 14 (I/O Port)

This controls the RS232 and Keypad sockets.

Once the register has been selected, it can be read via port \$FFFD and written via port \$BFFD.

Bit 0: KEYPAD CTS (out) - 0=Spectrum ready to receive, 1=Busy

Bit 1: KEYPAD RXD (out) - 0=Transmit high bit, 1=Transmit low bit

Bit 2: RS232 CTS (out) - 0=Spectrum ready to receive, 1=Busy

Bit 3: RS232 RXD (out) - 0=Transmit high bit, 1=Transmit low bit

Bit 4: KEYPAD DTR (in) - 0=Keypad ready for data, 1=Busy

Bit 5: KEYPAD TXD (in) - 0=Receive high bit, 1=Receive low bit

Bit 6: RS232 DTR (in) - 0=Device ready for data, 1=Busy

Bit 7: RS232 TXD (in) - 0=Receive high bit, 1=Receive low bit

The RS232 port also doubles up as a MIDI port, with communications to MIDI devices occurring at 31250 baud.

Commands and data can be sent to MIDI devices. Command bytes have the most significant bit set, whereas data bytes have it reset.

Socket Pin Outs

RS232/MIDI Socket

The RS232/MIDI socket is controlled by register 14 of the AY-3-8912 sound generator.

Front view

Pin	Signal
1	0V
2	TXD - In (Bit 7)
3	RXD - Out (Bit 3)
4	DTR - In (Bit 6)
5	CTS - Out (Bit 2)
6	12V

Keypad Socket

The keypad socket is controlled by register 14 of the AY-3-8912 sound generator.

Only bits 0 and 5 are used for communications with the keypad (pins 2 and 5).

Writing a 1 to bit 0 (pin 2) will eventually force the keypad to reset.

Summary information about the keypad and its communications protocol can be found in the Spectrum 128 Service Manual and a detailed description can be found at www.fruitcake.plus.com.

Front view

Pin	Signal
-----	--------

SPECTRUM +2 ROM o DISASSEMBLY

1	0V
2	OUT - Out (Bit 0)
3	n/u - In (Bit 4)
4	n/u - Out (Bit 1)
5	IN - In (Bit 5)
6	12V

n/u = Not used for keypad communications.

The keypad socket was later used by Amstrad to support a lightgun. There are no routines within the ROMs to handle communication with the lightgun so each game has to implement its own control software. Only bits 4 and 5 are used for communication with the lightgun (pins 3 and 5).

The connections to the lightgun are as follows:

Pin	Signal
1	0V
2	n/u - Out (Bit 0)
3	SENSOR - In (Bit 4)
4	n/u - Out (Bit 1)
5	TRIGGER - In (Bit 5)
6	12V

n/u = Not used for lightgun communication.

Monitor Socket

Pin	Signal	Level
1	Composite PAL	1.2V pk-pk (75 Ohms)
2	0 Volts	0V
3	Bright Output	TTL
4	Composite Sync	TTL
5	Vertical Sync	TTL
6	Green	TTL
7	Red	TTL
8	Blue	TTL

A detailed description of the monitor socket and circuitry, and how to construct a suitable RGB SCART cable can be found at www.fruitcake.plus.com.

ROM 0 Differences Between Models

The Spectrum +2 contains all of the functionality of the Spectrum 128 but excludes all routines relating to the Tape Tester option. Aside from this, the only other changes are to the copyright message and the message displayed when the Tape Loader option is invoked. All of the bugs that exist in the Spectrum 128 ROM 0 are still present in the Spectrum +2. English, Spanish and French versions of the

SPECTRUM +2 ROM 0 DISASSEMBLY

Spectrum +2 were produced and these differed only in the language of the menu and error messages. However, a consequence of these translations was that the location of various routines were shifted. The following shows a comparison of ROM 0 for the range of Spectrum +2 models and the Spectrum 128, and details how the address ranges correspond between them.
